01006487539 - 01110882717

الاسم

Prep [1] - Second Term - Unit [3] : Geometry And Measurement

Lesson [1] : Deductive Proof

Example [1]

In the opposite figure :

$\overline{AD} \cap \overline{BC} = \{E\}$ where $AE = DE$ and $BE = CE$

Prove that : $\triangle AEC \equiv \triangle DEB$

Solutions

Given $\overline{AD} \cap \overline{BC} = \{E\}$ where $AE = DE$, $BE = CE$

R.T.P. $\triangle AEC \equiv \triangle DEB$

Proof $\therefore \overline{AD} \cap \overline{BC} = \{E\} \therefore m(\angle AEC) = m(\angle DEB)$ (V.O.A)

\therefore In $\triangle AEC$ and $\triangle DEB$:

$\begin{cases} AE = DE \text{ (given)} \\ CE = BE \text{ (given)} \\ m(\angle AEC) = m(\angle DEB) \text{ (by proof)} \end{cases}$

$\therefore \triangle AEC \equiv \triangle DEB$

(Q.E.D.)

Example [2]

In the opposite figure :

$m(\angle BAC) = 80^\circ$, $m(\angle DCE) = 120^\circ$

and $m(\angle ACE) = 140^\circ$

Prove that : $\overline{AB} \parallel \overline{CD}$

Solutions

Given $m(\angle BAC) = 80^\circ$, $m(\angle DCE) = 120^\circ$,

$m(\angle ACE) = 140^\circ$

R.T.P. $\overline{AB} \parallel \overline{CD}$

Proof $\therefore m(\angle DCA) + m(\angle DCE) + m(\angle ACE) = 360^\circ$

لا تنس الاشتراك في
قنوات ذاكرولي
على تطبيق التليجرام

(accumulative angles at C)

$$\therefore m(\angle DCA) = 360^\circ - (120^\circ + 140^\circ) = 100^\circ$$

$$\therefore m(\angle BAC) + m(\angle DCA) = 80^\circ + 100^\circ = 180^\circ$$

And they are interior angles in the same side of the transversal \overleftrightarrow{AC}

$$\therefore \overline{AB} \parallel \overline{CD}$$

(Q.E.D.)

Lesson [2] : Part [1] : The Polygon

Before studying polygons we will study the types of the line as follows.

The simple line

It is the line that does not cut itself.

Examples for the simple line :

The non-simple line

It is the line that cuts itself once or more.

Examples for the non-simple line :

The closed line

It is the line that ends where it starts at the same point. It may be simple or non-simple.

Examples for the closed line :

The open line

It is the line whose starting point is not the end point. It may be simple or non-simple.

Examples for the open line :

The Polygon :

It is a simple closed line that consists of three line segments , or more. The polygon is named according to the number of its sides.

Examples for some polygons :

Triangle
(3 sides)

Quadrilateral
(4 sides)

Pentagon
(5 sides)

Heptagon
(7 sides)

Octagon
(8 sides)

Remarks

- 1 Each line segment of the line segments forming the polygon is called a side.
- 2 Each point resulted from intersecting of two adjacent sides of the polygon is called a vertex.
- 3 The sum of the side lengths of the polygon is called the perimeter of the polygon.
- 4 Each line segment joining two non-adjacent vertices of the polygon is called a diagonal of the polygon.
- 5 The included angle between two adjacent sides of the polygon is called an interior angle.
- 6 The included angle between a side of the polygon and the extension of its adjacent side is called an exterior angle.

Convex Polygon And Concave Polygon :

In the convex polygon :

If a straight line is drawn to pass through any two consecutive vertices, then the remained vertices lie on one side of this straight line.

Notice that :

Any interior angle of the convex polygon has measure less than 180°

In the concave polygon :

There are straight lines (one at least) passing through two consecutive vertices and the remained vertices lie on two different sides of the straight line.

Notice that :

There is at least one interior angle of concave polygon of measure more than 180° (reflex angle).

The Sum Of Measures Of The Interior Angles Of The Polygon :

∴ The sum of measures of the interior angles of a polygon of n sides equals $(n - 2) \times 180^\circ$

The sum of measures of the exterior angles of a convex polygon of n sides = 360°
(taking into account one exterior angle at each vertex)

The Regular Polygon :

The polygon is regular if :

- 1 All its sides are equal in length.
- 2 All its angles are equal in measure.

As examples for the regular polygons :

Equilateral triangle

Square

Regular pentagon

Regular hexagon

The Measure Of The Interior Angle Of A Regular Polygon :

∴ The measure of each interior angle of the regular polygon of n -sides = $\frac{(n - 2) \times 180^\circ}{n}$

For example:

- The measure of each interior angle of the equilateral triangle = $\frac{(3 - 2) \times 180^\circ}{3} = 60^\circ$
- The measure of each interior angle of the square = $\frac{(4 - 2) \times 180^\circ}{4} = 90^\circ$
- The measure of each interior angle of the regular pentagon = $\frac{(5 - 2) \times 180^\circ}{5} = 108^\circ$
- The measure of each interior angle of the regular hexagon = $\frac{(6 - 2) \times 180^\circ}{6} = 120^\circ$

Notice that :

The number of the polygon sides = The number of its vertices
= The number of its interior angles = The number of its exterior angles

Remarks

The number of sides of the regular polygon in which the measure of one of its interior

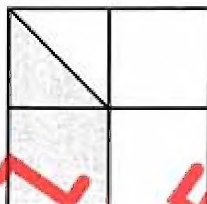

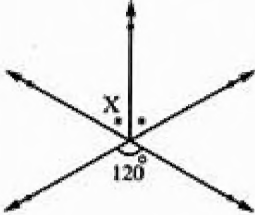

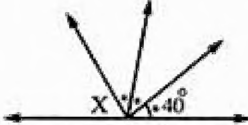

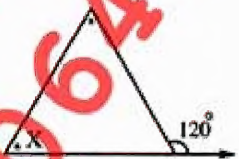

angles is $x^\circ = \frac{360^\circ}{180^\circ - x}$

Number of diagonals = $n(n - 3) \div 2$

Exercises

[A] : Choose The Correct Answer :

1	The measure of the right angle =° (a) 180 (b) 90 (c) 120 (d) 0
2	The angle whose measure 90° is angle. (a) acute (b) right (c) obtuse (d) straight
3	The sum of the measures of the accumulative angles at a point = (a) 90° (b) 180° (c) 270° (d) 360°
4	If $\triangle ABC \equiv \triangle XYZ$, then $AB =$ (a) XY (b) YZ (c) XZ (d) BC
5	The angle with measure 70° complement angle with measure° (a) 70 (b) 110 (c) 290 (d) 20
6	The acute angle supplements angle. (a) acute (b) right (c) obtuse (d) straight
7	The area of the circle = (a) πr (b) πr^2 (c) $2 \pi r$ (d) $2 \pi r^2$
8	The two bisectors of two adjacent supplementary angles included an angle of measure° (a) 180 (b) 45 (c) 90 (d) 0
9	The perpendicular to one of two parallel lines is to the other. (a) parallel (b) equal (c) congruent (d) perpendicular
10	The edge length of a cube whose total area is 600 cm^2 , is cm. (a) 10 (b) 100 (c) 300 (d) 90
11	The hexagon has sides. (a) 5 (b) 6 (c) 7 (d) 8
12	The pentagon has sides. (a) 3 (b) 4 (c) 5 (d) 6
13	The sum of the measures of the exterior angles of a polygon of n sides is (a) $(n - 2)$ (b) $(n - 2) \times 180^\circ$ (c) 360° (d) $\frac{(n - 2) \times 180^\circ}{n}$
14	The sum of the measures of the interior angles of a triangle =° (a) 90 (b) 360 (c) 180 (d) 540

15	The sum of the measures of the interior angles of a pentagon is (a) 360° (b) 450° (c) 720° (d) 540°	
16	The area of the shaded part = the total area of the shape. (a) $\frac{1}{8}$ (b) $\frac{1}{4}$ (c) $\frac{3}{8}$ (d) $\frac{3}{4}$	
17	In all the following shapes $m(\angle X) = 60^\circ$ except the shape (a)  (b)  (c)  (d) 	
18	The sum of measures of the exterior angles of the hexagon = (a) 720° (b) 120° (c) 180° (d) 360°	
19	The measure of the exterior angle of the equilateral triangle = (a) 60° (b) 90° (c) 30° (d) 120°	
20	If the number of sides of a regular polygon is 5 and if the measure of each interior angle is (X°) , then $X =$ (a) 90° (b) 108° (c) 120° (d) 180°	
21	The measure of the interior angle of a regular pentagon = (a) 900° (b) 180° (c) 540° (d) 108°	
22	The measure of each angle of the regular hexagon is (a) 90° (b) 180° (c) 120° (d) 144°	
23	The measure of the interior angle of a regular polygon of 18 sides equals (a) 130° (b) 140° (c) 150° (d) 160°	
24	How many sides has a regular polygon if the measure of each interior angle of it is 120° ? (a) 5 (b) 6 (c) 7 (d) 8	
25	If the measure of an interior angle of a regular polygon is 135° , then the number of its sides is (a) 6 (b) 4 (c) 7 (d) 8	
26	The number of diagonals of a quadrilateral is (a) 4 (b) 3 (c) 2 (d) 0	

[B] : Complete the Following : -

1	The angle of measure 180° its type is
2	The measure of the straight angle equals $^\circ$
3	The measure of the right angle = $^\circ$
4	The sum of the measures of the accumulative angles at a point is $^\circ$
5	The two vertically opposite angles are
6	If two straight lines intersect , then the measures of each two vertically opposite angles are
7	Every two vertically opposite angles are in measure.
8	Each two opposite angles in a parallelogram are
9	If two straight lines intersect , then the sum of measures of any two adjacent angles is
10	If a straight line intersects two parallel straight lines , then every two interior angles in the same side of the transversal are
11	<p>The opposite figure represents 3 squares each of side length 1 cm. , the perimeter of the figure =</p> 
12	A circle its radius length 10 cm. , then its circumference = (Consider $\pi = 3.14$)
13	The sum of the measures of the exterior angles of the convex polygon =
14	The sum of the measures of the angles of the quadrilateral equals
15	The measure of each interior angle of the regular hexagon is $^\circ$
16	The measure of each interior angle of the regular pentagon =

17 In the opposite figure :

$$x = \dots\dots\dots^\circ$$

18 In the opposite figure :

$$y = \dots\dots\dots^\circ$$

الاسم

Lesson [2] : Part [2] : The Polygon

Trapezium – Parallelogram – Rectangle – Rhombus – Square

Trapezium :

A quadrilateral in which only two sides are parallel is called a trapezium , as shown in the opposite figure in which :

$$\overline{XL} \parallel \overline{YZ}$$

Definition

Parallelogram is a quadrilateral , in which each two opposite sides are parallel.

In the opposite figure

ABCD is a parallelogram because

$$\overline{AB} \parallel \overline{DC} \text{ and } \overline{AD} \parallel \overline{BC}$$

Properties of parallelogram :

1 Each two opposite sides are equal in length.		<ul style="list-style-type: none"> • $AB = DC$ • $AD = BC$
2 Each two opposite angles are equal in measure.		<ul style="list-style-type: none"> • $m(\angle A) = m(\angle C)$ • $m(\angle B) = m(\angle D)$
3 The sum of measures of each two consecutive angles is 180°		<ul style="list-style-type: none"> • $m(\angle A) + m(\angle B) = 180^\circ$ • $m(\angle B) + m(\angle C) = 180^\circ$ • $m(\angle C) + m(\angle D) = 180^\circ$ • $m(\angle D) + m(\angle A) = 180^\circ$
4 The two diagonals bisect each other.		<ul style="list-style-type: none"> • $AM = CM$ • $BM = DM$

Remark [1]

The perimeter of the parallelogram = The sum of two consecutive sides $\times 2$

When does a quadrilateral represent a parallelogram ?

A quadrilateral represents a parallelogram if one of the following conditions satisfies

Each two opposite sides are parallel.

Each two opposite sides are equal in length.

Two opposite sides are parallel and equal in length.

Each two opposite angles are equal in measure.

The two diagonals bisect each other.

**Rectangle :**

Rectangle is a parallelogram with a right angle.

**Properties Of Rectangle :**

The rectangle has the same properties of the parallelogram and some additional properties as the following :

<p>1 The four angles of the rectangle are all equal in measure and the measure of each is 90°</p>		$m(\angle A) = m(\angle B)$ $= m(\angle C) = m(\angle D)$ $= 90^\circ$
<p>2 The two diagonals of the rectangle are equal in length.</p>		$AC = BD$ and as the two diagonals bisect each other , then $AM = BM = CM = DM$

Remark [2]

The perimeter of the rectangle = $(\text{length} + \text{width}) \times 2$

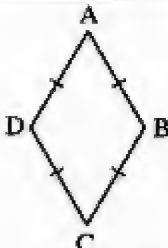

Rhombus :

Rhombus is a parallelogram in which two adjacent sides are equal in length.

Properties Of Rhombus :

The rhombus has the same properties of the parallelogram and some additional properties as the following :

<p>1 The four sides of the rhombus are all equal in length.</p>		<ul style="list-style-type: none"> • $AB = BC = CD = DA$
<p>2 The two diagonals of the rhombus are perpendicular and bisect each of its interior angles.</p>		<ul style="list-style-type: none"> • $\overline{AC} \perp \overline{BD}$ • $m(\angle 1) = m(\angle 2)$ $= m(\angle 3) = m(\angle 4)$ • $m(\angle 5) = m(\angle 6)$ $= m(\angle 7) = m(\angle 8)$

Remark [3]

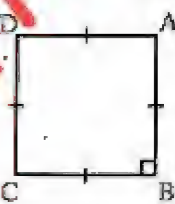

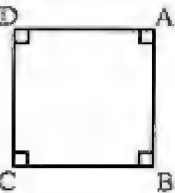

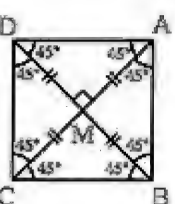

The perimeter of the rhombus = the length of one side $\times 4$

Square :

Square is a parallelogram with a right angle and two adjacent sides are equal in length.

**Properties Of Square :**

The square has the same properties of the parallelogram and some additional properties as the following :

<p>1 Its four sides are all equal in length.</p>		<ul style="list-style-type: none"> • $AB = BC = CD = DA$
<p>2 Its four angles are all equal in measure and each of them is of measure 90°</p>		<ul style="list-style-type: none"> • $m(\angle A) = m(\angle B)$ $= m(\angle C) = m(\angle D) = 90^\circ$
<p>3 Its two diagonals are equal in length , perpendicular and each diagonal bisects the two vertices angles which this diagonal joins.</p>		<ul style="list-style-type: none"> • $AC = BD$ and hence $AM = BM = CM = DM$ • $\overline{AC} \perp \overline{BD}$

Remark [4]

The perimeter of the square = the length of one side \times 4

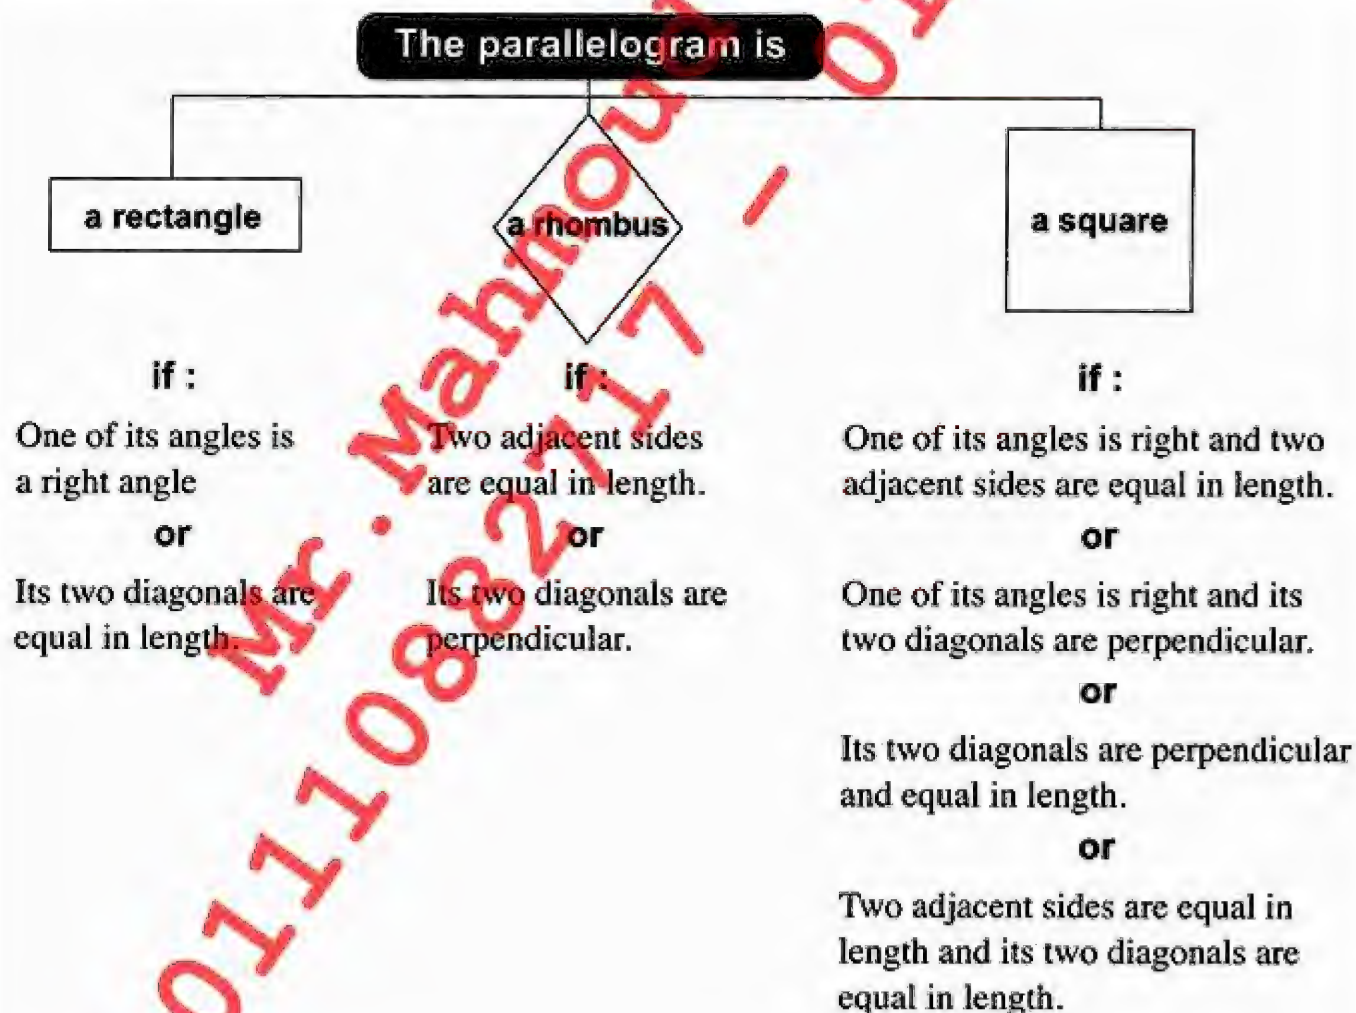

Notice That : -

We can also define the square as follows :

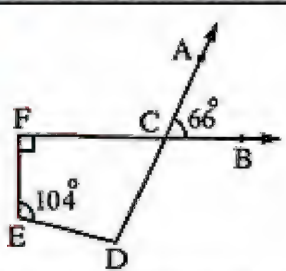

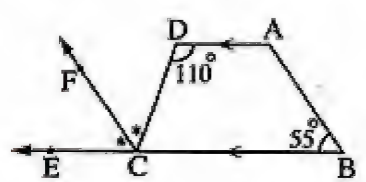

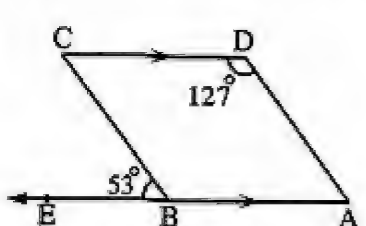

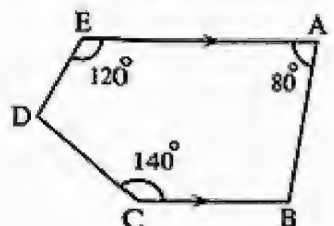

- 1 A square is a rectangle with two adjacent sides equal in length.
- 2 A square is a rectangle with two perpendicular diagonals.
- 3 A square is a rhombus with a right angle.
- 4 A square is a rhombus with two diagonals equal in length.

Notice That : -

To prove that the quadrilateral is a rectangle , a rhombus or a square , we must first prove that it is a parallelogram , as we see in the previous lesson , then :

Examples :

1	Calculate the sum of the measures of the interior angles of a hexagon. 2014 Exam (12) Question (3) (a)
2	Find the measure of each interior angle of regular hexagon. 2014 Exam (9) Question (4) (a)
3	How many sides does a regular polygon have if the measure of each interior angle of it is 120° ? 2014 Exam (6) Question (3) (b)
4	Find the number of sides of a regular polygon if the measure of one of its exterior angle is 45° 2015 Exam (5) Question (4) (a)
5	<p>In the opposite figure :</p> <p>$\overline{EF} \perp \overline{FB}$, $\overline{DA} \cap \overline{FB} = \{C\}$, $m(\angle ACB) = 66^\circ$, $m(\angle E) = 104^\circ$ Find : $m(\angle D)$</p>  <p>2015 Exam (15) Question (4) (b)</p>
6	<p>In the opposite figure :</p> <p>$\overline{AD} \parallel \overline{BC}$, \overline{CF} bisects $\angle DCE$ $m(\angle ABC) = 55^\circ$, $m(\angle ADC) = 110^\circ$ Prove that : $\overline{AB} \parallel \overline{CF}$</p>  <p>2017 Exam (12) Question (3) (a)</p>
7	<p>In the opposite figure :</p> <p>$\overline{DC} \parallel \overline{AB}$, $E \in \overline{AB}$, $m(\angle CBE) = 53^\circ$, $m(\angle D) = 127^\circ$ Prove that : $\overline{AD} \parallel \overline{BC}$</p>  <p>2015 Exam (11) Question (3) (a)</p>
8	<p>In the opposite figure :</p> <p>ABCDE is a pentagon in which $\overline{AE} \parallel \overline{BC}$, $m(\angle A) = 80^\circ$, $m(\angle C) = 140^\circ$, $m(\angle E) = 120^\circ$ Find : (1) $m(\angle B)$ (2) $m(\angle D)$</p>  <p>2015 Exam (4) Question (4) (a)</p>

In the opposite figure :

ABCDEF is a hexagon , $m(\angle B) = 90^\circ$,
 $m(\angle F) = 110^\circ$, $m(\angle E) = 165^\circ$, $m(\angle D) = 115^\circ$,
 $m(\angle FAB) = m(\angle DCB) = x$

Find : the value of x

2014 Exam (11) Question (3) (b)

In the opposite figure :

$m(\angle A) = 80^\circ$, $m(\angle D) = 120^\circ$
 $m(\angle CBE) = 130^\circ$

Find : $m(\angle C)$

Model Exam (5) Question (5) (a)

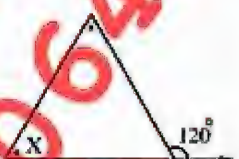

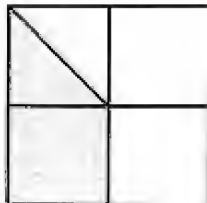

Solutions

1	The sum $= (6 - 2) \times 180^\circ = 720^\circ$
2	The measure of each interior angle $= \frac{(6 - 2) \times 180^\circ}{6} = 120^\circ$
3	The number of sides $= \frac{360^\circ}{180^\circ - 120^\circ} = 6$ sides
4	The number of sides $= \frac{360^\circ}{45^\circ} = 8$ sides
5	$\therefore \overrightarrow{DA} \cap \overrightarrow{FB} = \{C\}$ $\therefore m(\angle DCF) = m(\angle ACB) = 66^\circ$ (V.O.A.) From quadrilateral CDEF: $\therefore m(\angle D) = 360^\circ - (104^\circ + 66^\circ + 90^\circ) = 100^\circ$ (The req.)
6	$\therefore \overrightarrow{AD} \parallel \overrightarrow{BC}$, \overrightarrow{DC} is a transversal $\therefore m(\angle DCE) = m(\angle ADC) = 110^\circ$ (alternate angles) $\therefore \overrightarrow{CF}$ bisects $\angle DCE$ $\therefore m(\angle FCE) = \frac{110^\circ}{2} = 55^\circ$ $\therefore m(\angle B) = m(\angle FCE) = 55^\circ$ and they are corresponding angles. $\therefore \overrightarrow{AB} \parallel \overrightarrow{CF}$ (Q.E.D.)

7	$\therefore \overrightarrow{DC} \parallel \overrightarrow{AB}$, \overrightarrow{AD} is a transversal $\therefore m(\angle A) + m(\angle D) = 180^\circ$ (Two interior angles in the same side of the transversal). $\therefore m(\angle A) = 180^\circ - 127^\circ = 53^\circ$ $\therefore m(\angle A) = m(\angle CBE) = 53^\circ$ and they are corresponding angles. $\therefore \overrightarrow{AD} \parallel \overrightarrow{BC}$ (Q.E.D.)
8	$\therefore \overrightarrow{AE} \parallel \overrightarrow{BC}$, \overrightarrow{AB} is a transversal $\therefore m(\angle A) + m(\angle B) = 180^\circ$ Two interior angles in the same side of the transversal. $\therefore m(\angle B) = 180^\circ - 80^\circ = 100^\circ$ (First req.) From pentagon ABCDE : $\therefore m(\angle D) = 540^\circ - (120^\circ + 80^\circ + 100^\circ + 140^\circ) = 100^\circ$ (Second req.)
9	$\therefore 2x = 720^\circ - (110^\circ + 90^\circ + 165^\circ + 115^\circ) = 240^\circ$ $\therefore x = 240^\circ \div 2 = 120^\circ$ (The req.)
10	$\therefore B \in \overrightarrow{AE}$ $\therefore m(\angle ABC) = 180^\circ - 130^\circ = 50^\circ$ \therefore From the quadrilateral ABCD : $m(\angle C) = 360^\circ - (50^\circ + 80^\circ + 120^\circ) = 360^\circ - 250^\circ = 110^\circ$ (The req.)

Exercises

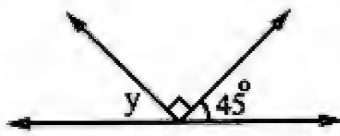

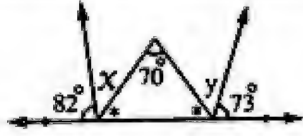

[A] : Choose The Correct Answer :

1	The acute angle supplements angle. (a) acute (b) right (c) obtuse (d) straight	
2	In all the following shapes $m(\angle X) = 60^\circ$ except the shape <div style="display: flex; justify-content: space-around; align-items: flex-end;"> <div style="text-align: center;">  <p>(a)</p> </div> <div style="text-align: center;">  <p>(b)</p> </div> <div style="text-align: center;">  <p>(c)</p> </div> <div style="text-align: center;">  <p>(d)</p> </div> </div>	
3	The sum of measures of the exterior angles of the hexagon = (a) 720° (b) 120° (c) 180° (d) 360°	
4	How many sides has a regular polygon if the measure of each interior angle of it is 120° ? (a) 5 (b) 6 (c) 7 (d) 8	
5	The diagonal of the square makes an angle of measure with any of its sides. (a) 60° (b) 45° (c) 120° (d) 90°	
6	The rectangle is a parallelogram each of its angles is (a) obtuse. (b) acute. (c) right. (d) straight.	
7	If ABCD is a rhombus , then $\overline{AC} \perp$ (a) \overline{BD} (b) \overline{AB} (c) \overline{BC} (d) \overline{CD}	
8	The number of axis of symmetry of a square equal (a) 0 (b) 1 (c) 2 (d) 4	
9	The angle with measure 70° complement angle with measure (a) 70 (b) 110 (c) 290 (d) 20	
10	The area of the shaded part = the total area of the shape. (a) $\frac{1}{8}$ (b) $\frac{1}{4}$ (c) $\frac{3}{8}$ (d) $\frac{3}{4}$	
11	The sum of the measures of the interior angles of a pentagon is (a) 360° (b) 450° (c) 720° (d) 540°	
12	The rhombus of diagonals equal in length is (a) a square. (b) a rectangle. (c) a trapezium. (d) a parallelogram.	

13	The measure of the interior angle of a regular polygon of 18 sides equals	(a) 130°	(b) 140°	(c) 150°	(d) 160°
14	The diagonals are equal in length and perpendicular in	(a) square.	(b) rhombus.	(c) rectangle.	(d) parallelogram.
15	The measure of the right angle = $^\circ$	(a) 180	(b) 90	(c) 120	(d) 0
16	If ABCD is a parallelogram in which $BC = 8$ cm. and $CD = 6$ cm. , then its perimeter =	(a) 14 cm.	(b) 28 cm.	(c) 48 cm.	(d) 56 cm.
17	The side length of the rhombus which its perimeter 36 cm. is cm.	(a) 6	(b) 9	(c) 18	(d) 4
18	If ABCD is a square , then $(AC)^2 =$	(a) AB	(b) $(AB)^2$	(c) $2 (AB)^2$	(d) $4 (AB)^2$
19	If $\triangle ABC \equiv \triangle XYZ$, then $AB =$	(a) XY	(b) YZ	(c) XZ	(d) BC
20	The edge length of a cube whose total area is 600 cm^2 . is cm.	(a) 10	(b) 100	(c) 300	(d) 90
21	The sum of the measures of the interior angles of a triangle = $^\circ$	(a) 90	(b) 360	(c) 180	(d) 540
22	The measure of each angle of the regular hexagon is	(a) 90°	(b) 180°	(c) 120°	(d) 144°
23	In the the two diagonals are perpendicular and not equal in length.	(a) square	(b) rhombus	(c) rectangle	(d) parallelogram
24	ABCD is a parallelogram , $m(\angle A) = 70^\circ$, then $m(\angle C) =$ $^\circ$	(a) 110	(b) 35	(c) 70	(d) 140
25	In a parallelogram if the adjacent sides are equal in the length , then the shape is	(a) square.	(b) rhombus.	(c) rectangle.	(d) trapezium.
26	ABCD is a square , then $m(\angle BAC) =$ $^\circ$	(a) 90	(b) 60	(c) 45	(d) 30
27	If the side length of a square is 10.5 cm. , then the perimeter of this square = cm.	(a) 40	(b) 42	(c) 50	(d) 100
28	* The parallelogram whose two diagonals are equal in length and perpendicular is called	(a) rectangle.	(b) square.	(c) rhombus.	(d) trapezium.

[B] : Complete the Following : -

1	The angle of measure 180° its type is
2	If two straight lines intersect , then the measures of each two vertically opposite angles are
3	A circle its radius length 10 cm. , then its circumference = (Consider $\pi = 3.14$)
4	Each two opposite angles in a parallelogram are
5	If ABCD is a parallelogram in which : $m(\angle A) = 120^\circ$, then $m(\angle B) = \dots\dots\dots^\circ$
6	The rectangle is a parallelogram in which one of it's angles is
7	The number of axis of symmetry of square is
8	The two vertically opposite angles are
9	<p>The opposite figure represents 3 squares each of side length 1 cm. , the perimeter of the figure =</p> 
10	If two opposite sides in the quadrilateral are parallel , then it is called
11	ABCD is parallelogram in which $m(\angle A) = 100^\circ$, then $m(\angle D) = \dots\dots\dots^\circ$
12	If ABCD is rectangle and if $AB = 4$ cm. , $BD = 5$ cm. , then the area of the rectangle =
13	Square is a rectangle in which
14	The sum of the measures of the accumulative angles at a point is
15	If a straight line intersects two parallel straight lines , then every two interior angles in the same side of the transversal are
16	The measure of each interior angle of the regular pentagon =

- 17 If ABCD is a parallelogram in which $m(\angle A) = 80^\circ$, then $m(\angle B) = \dots\dots\dots$
- 18 Two diagonals are equal in length and not perpendicular in $\dots\dots\dots$
- 19 The rhombus with a right angle is $\dots\dots\dots$
- 20 The measure of the right angle = $\dots\dots\dots^\circ$
- 21 If two straight lines intersect , then the sum of measures of any two adjacent angles is $\dots\dots\dots$
- 22 The measure of each interior angle of the regular hexagon is $\dots\dots\dots^\circ$
- 23 ABCD is a parallelogram in which $m(\angle A) = 60^\circ$, then $m(\angle B) = \dots\dots\dots$
- 24 In the parallelogram XYZL , if $m(\angle X) = \frac{1}{2} m(\angle Y)$, then $m(\angle Y) = \dots\dots\dots^\circ$
- 25 The length of the side of a rhombus whose perimeter is 24 cm. equals $\dots\dots\dots$ cm.
- 26 In the oppoiste figure :
 $y = \dots\dots\dots^\circ$

- 27 The measure of the straight angle equals $\dots\dots\dots^\circ$
- 28 Each two opposite angles in a parallelogram are $\dots\dots\dots$
- 29 The sum of the measures of the angles of the quadrilateral equals $\dots\dots\dots$
- 30 ABCD is a parallelogram in which $m(\angle A) = 50^\circ$, then $m(\angle B) = \dots\dots\dots$
- 31 In the parallelogram XYZL , if $m(\angle X) = \frac{1}{3} m(\angle Y)$, then $m(\angle L) = \dots\dots\dots^\circ$
- 32 The number of axes of symmetry of the rhombus is $\dots\dots\dots$ axes.
- 33 In the opposite figure :
 $x + y = \dots\dots\dots^\circ$

1

Using the geometric tools , draw the angle ABC of measure 140
 , then bisect it. (don't remove arcs).

2017 Exam (12) Question (4) (b)

2

In the opposite figure :
 Find : $m(\angle ABF)$

2016 Exam (3) Question (4) (b)

3

In the opposite figure :
 $m(\angle A) = 80^\circ$, $m(\angle D) = 120^\circ$,
 $m(\angle CBE) = 130^\circ$ and $B \in \overline{AE}$
 Find with proof : $m(\angle C)$

2016 Exam (6) Question (3) (a)

4

In the opposite figure :
 $\overline{DA} \parallel \overline{BE}$, \overline{BA} bisects $\angle DBE$,
 $m(\angle ADB) = 50^\circ$ and $m(\angle C) = 65^\circ$
 Prove that : ABCD is a parallelogram.

2016 Exam (13) Question (4) (a)

5

In the opposite figure :
 Find : the value of X

2016 Exam (4) Question (3) (b)

6

In the opposite figure :
 $E \in \overline{DA}$, $m(\angle EAB) = 120^\circ$
 $m(\angle C) = 60^\circ$, $\overline{DA} \parallel \overline{CB}$
 Prove that : ABCD is a parallelogram

2018 Exam (4) Question (5) (a)

- 7 In the opposite figure :
 ABCD is a rhombus in which :
 $m(\angle A) = 50^\circ$, find : $m(\angle ABD)$

- 8 In the opposite figure :
 $B \in \overleftrightarrow{AC}$, $m(\angle CBE) = 116^\circ$
 and \overleftrightarrow{BD} bisect $\angle ABE$
 Find with proof : $m(\angle ABD)$

- 9 In the opposite figure :
 $\overleftrightarrow{DC} \parallel \overleftrightarrow{AB}$, $m(\angle D) = 53^\circ$
 and $m(\angle CBE) = 127^\circ$
 Prove that : ABCD is a parallelogram.

- 10 In the opposite figure :
 ABCD is a quadrilateral
 in which : $m(\angle A) = 90^\circ$
 Find : the value of X

- 11 In the opposite figure :
 $\overleftrightarrow{AB} \parallel \overleftrightarrow{CD}$, $m(\angle A) = 50^\circ$,
 $\angle ACE$ is right angle ,
 and $m(\angle E) = 40^\circ$
 Prove that : $\overleftrightarrow{AB} \parallel \overleftrightarrow{EF}$

- 12 In the opposite figure :
 Find the value of X

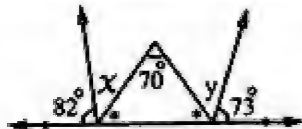

Homework

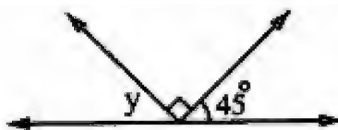

[A] : Choose The Correct Answer :

1	The side length of the rhombus which its perimeter 36 cm. is cm. (a) 6 (b) 9 (c) 18 (d) 4
2	ABCD is a parallelogram , $m(\angle A) = 70^\circ$, then $m(\angle C) =$ (a) 110 (b) 35 (c) 70 (d) 140
3	The two diagonals are equal in length and not perpendicular in (a) a rectangle (b) a square (c) a rhombus (d) a parallelogram
4	If the number of sides of a regular polygon is 5 and if the measure of each interior angle is (X°) , then $X =$ (a) 90° (b) 108° (c) 120° (d) 180°
5	If the measure of an interior angle of a regular polygon is 135° , then the number of its sides is (a) 6 (b) 4 (c) 7 (d) 8
6	In the the two diagonals are perpendicular and not equal in length. (a) square (b) rhombus (c) rectangle (d) parallelogram
7	The measure of the interior angle of a regular pentagon = (a) 900° (b) 180° (c) 540° (d) 108°
8	The pentagon has sides. (a) 3 (b) 4 (c) 5 (d) 6
9	The measure of the exterior angle of the equilateral triangle = (a) 60° (b) 90° (c) 30° (d) 120°
10	The measure of each angle of the regular hexagon is (a) 90° (b) 180° (c) 120° (d) 144°
11	The sum of the measures of the exterior angles of a polygon of n sides is (a) $(n - 2)$ (b) $(n - 2) \times 180^\circ$ (c) 360° (d) $\frac{(n - 2) \times 180^\circ}{n}$
12	The two bisectors of two adjacent supplementary angles included an angle of measure (a) 180 (b) 45 (c) 90 (d) 0
13	The hexagon has sides. (a) 5 (b) 6 (c) 7 (d) 8
14	The sum of the measures of the interior angles of a triangle = (a) 90 (b) 360 (c) 180 (d) 540

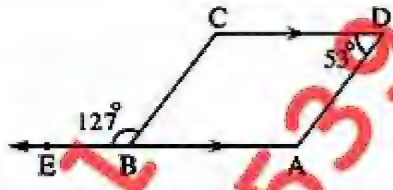

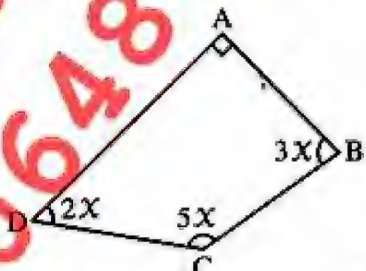

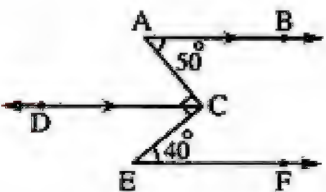

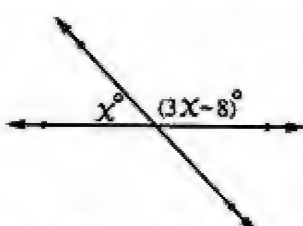

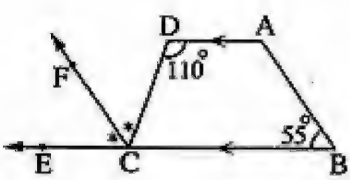

15	The perpendicular to one of two parallel lines is to the other. (a) parallel (b) equal (c) congruent (d) perpendicular
16	The angle whose measure 90° is angle. (a) acute (b) right (c) obtuse (d) straight
17	The area of the circle = (a) πr (b) πr^2 (c) $2\pi r$ (d) $2\pi r^2$
18	The edge length of a cube whose total area is 600 cm^2 . is cm. (a) 10 (b) 100 (c) 300 (d) 90
19	The sum of the measures of the accumulative angles at a point = (a) 90° (b) 180° (c) 270° (d) 360°
20	The area of square of side length 3 cm is cm^2 (a) 9 (b) 6 (c) 12 (d) 3
21	The perimeter of a square with side length 6 cm. = cm. (a) 30 (b) 36 (c) 24 (d) 216
22	The diagonal of square divided its vertex angle in two angles of the measure of each of them is (a) 30° (b) 45° (c) 60° (d) 90°
23	If $\triangle ABC \equiv \triangle XYZ$, then $AB =$ (a) XY (b) YZ (c) XZ (d) BC
24	If the side length of a square is 10.5 cm., then the perimeter of this square = cm. (a) 40 (b) 42 (c) 50 (d) 100
25	* The parallelogram whose two diagonals are equal in length and perpendicular is called (a) rectangle. (b) square. (c) rhombus. (d) trapezium.
26	The rectangle of perpendicular diagonals is (a) a parallelogram. (b) a square. (c) a rhombus. (d) a trapezium.
27	If ABCD is a rhombus and $m(\angle ACB) = 32^\circ$, then $m(\angle B) =$ (a) 148° (b) 161° (c) 116° (d) 32°
28	If ABCD is a square, then $(AC)^2 =$ (a) AB (b) $(AB)^2$ (c) $2(AB)^2$ (d) $4(AB)^2$
29	ABCD is a square, then $m(\angle BAC) =$ (a) 90 (b) 60 (c) 45 (d) 30
30	If ABCD is a parallelogram, then $m(\angle A) = m(\angle \dots)$ (a) B (b) C (c) D (d) nothing

Lesson [3] : The Triangle

Theorem (1)

The sum of the measures of the interior angles of a triangle is 180°

Given	ABC is a triangle
R.T.P.	$m(\angle A) + m(\angle B) + m(\angle ACB) = 180^\circ$
Construction	Draw $\overrightarrow{CX} \parallel \overrightarrow{AB}$
Proof	<p>$\therefore \angle XCY$ is a straight angle</p> <p>$\therefore m(\angle XCA) + m(\angle ACB) + m(\angle BCY) = 180^\circ$</p> <p>$\therefore \overrightarrow{XY} \parallel \overrightarrow{AB}$</p> <p>$\therefore m(\angle XCA) = m(\angle A)$ (alternate angles)</p> <p>$\therefore m(\angle YCB) = m(\angle B)$ (alternate angles)</p> <p>$\therefore m(\angle A) + m(\angle ACB) + m(\angle B) = 180^\circ$ (Q.E.D.)</p>

The exterior angle of the triangle

In the opposite figure :

If ABC is a triangle , $D \in \overrightarrow{CB}$ and $D \notin \overrightarrow{CB}$, then $\angle ABD$

is called an exterior angle of $\triangle ABC$

$$\therefore m(\angle ABD) = m(\angle A) + m(\angle C)$$

Notice That :

In the opposite figure :

$\angle ACD$ is not an exterior angle of $\triangle ABC$

because $D \notin \overrightarrow{BC}$

The measure of the exterior angle of a triangle :

The measure of the exterior angle of a triangle is equal to the sum of the measures of its non adjacent interior angles.

The measure of the exterior angle of a triangle is greater than the measure of any interior angle of the triangle except its adjacent angle.

Remark [1]

If two angles of one triangle equal two angles of another triangle in measure , then the third angle of the first triangle is equal in measure to the third angle of the other triangle.

In $\triangle ABC$ and DEF ,

if $m(\angle A) = m(\angle D)$ and $m(\angle B) = m(\angle E)$,

then $m(\angle C) = m(\angle F)$

“You can check the truth of the previous by measuring”

**Remark [2]**

- If the sum of measures of two angles in a triangle equals 90° , then the third angle is right.
- If the sum of measures of two angles in a triangle is less than 90° , then the third angle is obtuse.
- If the sum of measures of two angles in a triangle is more than 90° , then the third angle is acute.

Remark [3]

If the measure of an angle in a triangle equals the sum of measures of the other two angles , then the triangle is right-angled.

Theorem (2)

The ray drawn from the midpoint of a side of a triangle parallel to another side bisects the third side.

Given	D is the midpoint of \overline{AB} , $\overline{DE} \parallel \overline{BC}$
R.T.P.	E is the midpoint of \overline{AC}
Construction	Draw $\overline{AX} \parallel \overline{BC}$
Proof	$\therefore \overline{AX} \parallel \overline{DE} \parallel \overline{BC}$ $\therefore \overline{AB}$ and \overline{AC} are two transversals to them at D and E respectively. $\therefore AD = DB \quad \therefore AE = EC$ $\therefore E$ is the midpoint of \overline{AC}

(Q.E.D.)

Corollary

The line segment joining the midpoints of two sides of a triangle is parallel to the third side.

In the opposite figure :

If ABC is a triangle in which D
is the midpoint of \overline{AC} ,

E is the midpoint of \overline{AB} , then : $\overline{ED} \parallel \overline{BC}$

**Theorem (3)**

The length of the line segment joining the midpoints of two sides of a triangle is equal to half the length of the third side.

Given

ABC is a triangle , D is the midpoint
of \overline{AB} , H is the midpoint of \overline{AC}

R.T.P.

$$DH = \frac{1}{2} BC$$

Construction

Draw $\overline{HO} \parallel \overline{AB}$ to cut \overline{BC} at O

Proof

\because D is the midpoint of \overline{AB} , H is the midpoint of \overline{AC}

$\therefore \overline{DH} \parallel \overline{BC}$ (corollary)

$\because \overline{HO} \parallel \overline{AB}$ (construction) , H is the midpoint of \overline{AC}

\therefore O is the midpoint of \overline{BC}

$$\therefore BO = \frac{1}{2} BC$$

\because The figure DHOB is a parallelogram.

$$\therefore DH = BO = \frac{1}{2} BC$$

(Q.E.D.)

**Examples :**

In the opposite figure :

XYZ is a triangle , $L \in \overline{YZ}$, $m(\angle XZL) = 130^\circ$,
 $m(\angle X) = 70^\circ$

Find with proof : (1) $m(\angle Y)$ (2) $m(\angle YZX)$

2015 Exam (9) Question (5) (a)

In the opposite figure :

$m(\angle A) = m(\angle B) = 25^\circ$

Find : $m(\angle ACD)$

Model Exam (1) Question (3) (a)

3

In the opposite figure : $\overline{DE} \parallel \overline{BC}$, $m(\angle DAB) = 82^\circ$ and $m(\angle D) = 32^\circ$ **Find by proof :** $m(\angle B)$ 

2016 Exam (7) Question (3) (a)

4

In the opposite figure : $\overline{DE} \parallel \overline{OH} \parallel \overline{BC}$, $m(\angle ADE) = 120^\circ$, $m(\angle AOH) = 135^\circ$ **Find the measures of the angles of :** $\triangle ABC$ 

2014 Exam (2) Question (3) (a)

5

In the opposite figure :EDCF is a quadrilateral , $\triangle ABC$ is an equilateral triangle where $\overline{DB} \cap \overline{AF} = \{C\}$ **Find with proof :** $m(\angle F)$ 

2015 Exam (5) Question (4) (b)

6

In the opposite figure : \overline{AB} and \overline{ED} are perpendicular to \overline{BD} , $\overline{BD} \cap \overline{AO} = \{C\}$, $m(\angle A) = 30^\circ$, $m(\angle EOC) = 120^\circ$,**Find :** $m(\angle E)$ 

Model Exam (2) Question (4) (b)

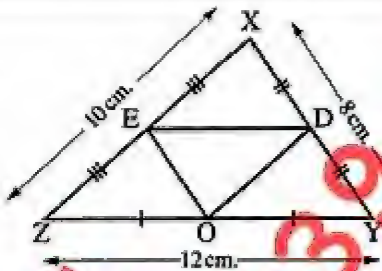

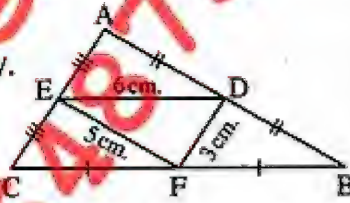

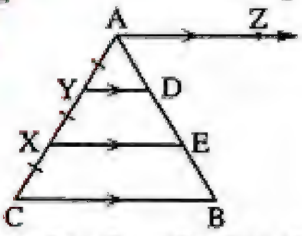

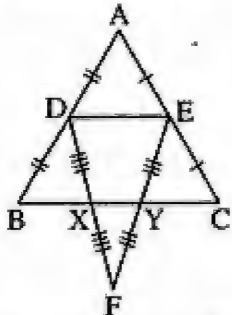

7

In the opposite figure :

ABC is triangle in which D , E

and F are the midpoints of \overline{AB} , \overline{BC} and \overline{CA} respectively , $BC = 16$ cm. , $AC = 12$ cm.**Find the perimeter of the quadrilateral :** DECF with proof

2015 Exam (15) Question (4) (a)

8	<p>In the opposite figure :</p> <p>D , O and E are midpoints of \overline{XY} , \overline{YZ} and \overline{XZ} respectively.</p> <p>$\angle XY = 8 \text{ cm.}$, $\angle YZ = 12 \text{ cm.}$, $\angle XZ = 10 \text{ cm.}$</p> <p>Find with proof : The perimeter of $\triangle EOD$</p>	 <p>2017 Exam (9) Question (5) (a)</p>
9	<p>In the opposite figure :</p> <p>E , D and F are the midpoints of \overline{AC} , \overline{AB} and \overline{BC} respectively.</p> <p>$ED = 6 \text{ cm.}$, $DF = 3 \text{ cm.}$ and $EF = 5 \text{ cm.}$</p> <p>Find with proof : The perimeter of $\triangle ABC$</p>	 <p>2017 Exam (5) Question (3) (b)</p>
10	<p>In the opposite figure :</p> <p>$\overline{AZ} \parallel \overline{YD} \parallel \overline{XE} \parallel \overline{CB}$,</p> <p>$AY = YX = XC$, $AB = 18 \text{ cm.}$,</p> <p>Find : The length of \overline{EB}</p>	 <p>Model Exam (1) Question (4) (b)</p>
11	<p>In the opposite figure :</p> <p>D is the midpoint of \overline{AB} , E is the midpoint of \overline{AC}</p> <p>$\angle DX = XF$, $\angle EY = FY$</p> <p>$\angle BC = 12 \text{ cm.}$</p> <p>Find : The length of \overline{XY}</p>	 <p>2017 Exam (5) Question (4) (b)</p>

Solutions

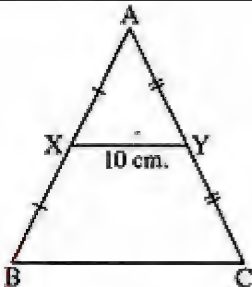

1	<p>$\therefore \angle XZL$ is an exterior angle of $\triangle XYZ$</p> <p>$\therefore m(\angle Y) = 130^\circ - 70^\circ = 60^\circ$ (First req.)</p> <p>\therefore From $\triangle XYZ$: $m(\angle YZX) = 180^\circ - (70^\circ + 60^\circ)$</p> <p>$= 50^\circ$ (Second req.)</p>	<p>2</p> <p>$\therefore m(\angle A) = m(\angle B) = 25^\circ$</p> <p>$\angle ACD$ is an exterior angle of $\triangle ABC$</p> <p>$\therefore m(\angle ACD) = 25^\circ + 25^\circ = 50^\circ$ (The req.)</p>
---	---	---

3	$\therefore \overline{DE} \parallel \overline{BC}$, \overline{CD} is a transversal $\therefore m(\angle C) = m(\angle D) = 32^\circ$ (alternate angles) $\therefore \angle DAB$ is an exterior angle of $\triangle ABC$ $\therefore m(\angle B) = 82^\circ - 32^\circ = 50^\circ$ (The req.)
4	$\therefore \overline{OH} \parallel \overline{BC}$, \overline{OB} is a transversal $\therefore m(\angle B) + m(\angle O) = 180^\circ$ (Two interior angles in the same side of the transversal) $\therefore m(\angle B) = 180^\circ - 135^\circ = 45^\circ$ $\therefore \overline{DE} \parallel \overline{BC}$, \overline{CD} is a transversal $\therefore m(\angle C) + m(\angle D) = 180^\circ$ (Two interior angles in the same side of the transversal) $\therefore m(\angle C) = 180^\circ - 120^\circ = 60^\circ$ In $\triangle ABC$: $\therefore m(\angle BAC) = 180^\circ - (45^\circ + 60^\circ) = 75^\circ$ (The req.)
5	$\therefore \triangle ABC$ is an equilateral triangle. $\therefore m(\angle ACB) = \frac{180^\circ}{3} = 60^\circ$ $\therefore m(\angle DCF) = m(\angle ACB) = 60^\circ$ (V.O.A) From quadrilateral EDCF: $\therefore m(\angle F) = 360^\circ - (60^\circ + 120^\circ + 118^\circ) = 62^\circ$ (The req.)
6	In $\triangle ABC$: $m(\angle ACB) = 180^\circ - (90^\circ + 30^\circ) = 60^\circ$ $\therefore \overline{BD} \cap \overline{AO} = \{C\}$ $\therefore m(\angle ACB) = m(\angle OCD) = 60^\circ$ (V.O.A) $\therefore m(\angle E) = 360^\circ - (60^\circ + 120^\circ + 90^\circ) = 90^\circ$ (The req.)
7	$\therefore D$ is the midpoint of \overline{AB} $\therefore E$ is the midpoint of \overline{BC} $\therefore DE = \frac{1}{2} AC = \frac{1}{2} \times 12 = 6$ cm. $\therefore D$ is the midpoint of \overline{AB} $\therefore F$ is the midpoint of \overline{AC} $\therefore DF = \frac{1}{2} BC = \frac{1}{2} \times 16 = 8$ cm. $\therefore E$ is the midpoint of \overline{BC} $\therefore CE = \frac{1}{2} BC = \frac{1}{2} \times 16 = 8$ cm. $\therefore F$ is the midpoint of \overline{AC} $\therefore CF = \frac{1}{2} AC = \frac{1}{2} \times 12 = 6$ cm.

	\therefore The perimeter of DECF = $6 + 8 + 6 + 8 = 28$ cm. (The req.)
8	In $\triangle XYZ$: $\therefore E$ is the midpoint of \overline{XZ} $\therefore O$ is the midpoint of \overline{ZY} $\therefore EO = \frac{1}{2} XY = \frac{1}{2} \times 8 = 4$ cm. $\therefore O$ is the midpoint of \overline{ZY} $\therefore D$ is the midpoint of \overline{XY} $\therefore OD = \frac{1}{2} XZ = \frac{1}{2} \times 10 = 5$ cm. $\therefore D$ is the midpoint of \overline{XY} $\therefore E$ is the midpoint of \overline{XZ} $\therefore ED = \frac{1}{2} YZ = \frac{1}{2} \times 12 = 6$ cm. \therefore The perimeter of $\triangle EOD = 4 + 5 + 6 = 15$ cm. (The req.)
9	\therefore In $\triangle ABC$: $\therefore D$ is the midpoint of \overline{AB} $\therefore E$ is the midpoint of \overline{AC} $\therefore BC = 2 DE = 2 \times 6 = 12$ cm. $\therefore D$ is the midpoint of \overline{AB} $\therefore F$ is the midpoint of \overline{BC} $\therefore AC = 2 DF = 2 \times 3 = 6$ cm. $\therefore E$ is the midpoint of \overline{AC} $\therefore F$ is the midpoint of \overline{BC} $\therefore AB = 2 EF = 2 \times 5 = 10$ cm. \therefore the perimeter of $\triangle ABC = 12 + 6 + 10 = 28$ cm. (The req.)
10	$\therefore \overline{AZ} \parallel \overline{YD} \parallel \overline{XE} \parallel \overline{CB}$, $AY = YX = XC$ $\therefore AD = DE = EB$ $\therefore EB = \frac{18}{3} = 6$ cm. (The req.)
11	In $\triangle ABC$: $\therefore D$ is the midpoint of \overline{AB} $\therefore E$ is the midpoint of \overline{AC} $\therefore DE = \frac{1}{2} BC = \frac{1}{2} \times 12 = 6$ cm. In $\triangle EFD$: $\therefore X$ is the midpoint of \overline{FD} $\therefore Y$ is the midpoint of \overline{EF} $\therefore XY = \frac{1}{2} ED = \frac{1}{2} \times 6 = 3$ cm. (The req.)

Exercises

[A] : Choose The Correct Answer :

1	The sum of measures of the angles of a triangle is	(a) 90°	(b) 180°	(c) 270°	(d) 360°
2	The parallelogram whose two diagonals are is called a rectangle.	(a) parallel	(b) perpendicular	(c) equal in length	(d) bisect each other
3	The rectangle is a parallelogram each of its angles is	(a) obtuse.	(b) acute.	(c) right.	(d) straight.
4	The two diagonals are equal in length and not perpendicular in	(a) a rectangle	(b) a square	(c) a rhombus	(d) a parallelogram
5	The sum of measures of the exterior angles of the hexagon =	(a) 720°	(b) 120°	(c) 180°	(d) 360°
6	The area of the circle =	(a) πr	(b) πr^2	(c) $2\pi r$	(d) $2\pi r^2$
7	<p>In the opposite figure :</p> <p>X and Y are midpoints of \overline{AB} and \overline{AC} respectively</p> <p>, $XY = 10$ cm. , then $BC =$ cm.</p> <p>(a) 5</p> <p>(b) 10</p> <p>(c) 20</p> <p>(d) 30</p>				
8	The length of the line segment joining the midpoints of two sides of a triangle is equal to the length of the third side.	(a) half	(b) quarter	(c) twice	(d) third
9	Any triangle has at least two angles.	(a) reflex	(b) obtuse	(c) acute	(d) right
10	The diagonals are equal in length and perpendicular in	(a) square.	(b) rhombus.	(c) rectangle.	(d) parallelogram.
11	In the the two diagonals are perpendicular and not equal in length.	(a) square	(b) rhombus	(c) rectangle	(d) parallelogram
12	The measure of the exterior angle of the equilateral triangle =	(a) 60°	(b) 90°	(c) 30°	(d) 120°

13	The two bisectors of two adjacent supplementary angles included an angle of measure° (a) 180 (b) 45 (c) 90 (d) 0
14	In the opposite figure : X , Y are midpoints of \overline{AB} , \overline{AC} respectively , $BC = 10$ cm. , then $XY =$ cm. (a) 5 (b) 20 (c) 10 (d) 30
15	The length of the line segment joining between two midpoints of two sides of a triangle = length of its third side. (a) $\frac{1}{5}$ (b) $\frac{1}{4}$ (c) $\frac{1}{3}$ (d) $\frac{1}{2}$
16	The sum of the interior angles of an isosceles triangle = (a) 180° (b) 90° (c) 60° (d) 45°
17	If ABCD is a square , then $(AC)^2 =$ (a) AB (b) $(AB)^2$ (c) $2 (AB)^2$ (d) $4 (AB)^2$
18	ABCD is a square , then $m (\angle BAC) =$° (a) 90 (b) 60 (c) 45 (d) 30
19	The measure of the interior angle of a regular pentagon = (a) 900° (b) 180° (c) 540° (d) 108°
20	If the number of sides of a regular polygon is 5 and if the measure of each interior angle is (X°) , then $X =$ (a) 90° (b) 108° (c) 120° (d) 180°
21	The perpendicular to one of two parallel lines is to the other. (a) parallel (b) equal (c) congruent (d) perpendicular
22	In the opposite figure : $ED : BC =$ (a) 1 : 1 (b) 1 : 2 (c) 1 : 3 (d) 1 : 4
23	The line segment joining the midpoints of two sides of a triangle is the third side. (a) perpendicular to (b) equal to (c) parallel to (d) bisect to
24	The sum of the measures of the exterior angles of triangle = (a) 90° (b) 180° (c) 360° (d) 120°

[B] : Complete the Following : -

1	Any triangle has at least two interior angles.
2	The number of axis of symmetry of the isosceles triangle =
3	The sum of the measures of the interior angles of a triangle =
4	The measure of the exterior angle of a triangle is
5	The measure of the exterior angle of any vertex of the equilateral triangle =°
6	The measure of the exterior angle of a triangle is equal to the sum of
7	The ray drawn from the midpoint of a side of a triangle parallel to another side the third side.
8	The ray drawn parallel to one side of triangle and passing through the midpoint of another side
9	The line segment joining midpoints of two sides of a triangle is
10	The line segment joining between two midpoints of two sides of triangle is parallel to
11	The line segment joining the midpoint of two sides of a triangle is the third side.
12	The length of the line segment joining the midpoints of two sides of a triangle is equal to the third side.
13	The length of the line segment joining the midpoints of two sides of a triangle equals
14	<p>In the opposite figure :</p> <p>If $ED = 8$ cm.</p> <p>, then $BC =$ cm.</p>

15	<p>In the opposite figure :</p> <p>If $BC = 22$ cm.</p> <p>, then $ED = \dots\dots\dots$ cm.</p>

17	<p>In the opposite figure :</p> <p>ABC is an equilateral triangle</p> <p>where D , E and F are the midpoints of</p> <p>\overline{AB} , \overline{BC} and \overline{AC} respectively ,</p> <p>and $\overline{AE} \cap \overline{BF} \cap \overline{CD} = \{M\}$</p> <p>Then the image of ΔAMD by reflection in \overline{AE} is</p>	
18	The angle of measure 180° its type is	
19	The measure of the straight angle equals $^\circ$	
20	The measure of the right angle = $^\circ$	
21	The sum of the measures of the accumulative angles at a point is $^\circ$	
22	The two vertically opposite angles are	
23	If two straight lines intersect , then the measures of each two vertically opposite angles are	
24	Every two vertically opposite angles are in measure.	
25	Each two opposite angles in a parallelogram are	

[C] : Essay Problems : -

1

Prove that : the ray drawn from the midpoint of a side of a triangle parallel to another side bisects the third side.

2018 Exam (4) Question (3) (a)

2

In the opposite figure :

$\overline{DE} \parallel \overline{BC}$, $m(\angle DAB) = 82^\circ$

and $m(\angle D) = 32^\circ$

Find by proof : $m(\angle B)$

2016 Exam (7) Question (3) (a)

3

In the opposite figure :

ABC is a triangle in which D and E are the midpoints of \overline{AB} and \overline{AC} respectively , $AB = 7$ cm. , $BC = 9$ cm. and $AC = 6$ cm.

Find : the perimeter of $\triangle ADE$

2016 Exam (11) Question (3) (b)

4

In the opposite figure :

X , Y , Z are the midpoints of \overline{AB} , \overline{BC} , \overline{CA} respectively.

If $XY = 5$ cm. , $YZ = 3$ cm. and $XZ = 6$ cm.

Find with proof the perimeter of $\triangle ABC$

2018 Exam (6) Question (3) (b)

5

In the opposite figure :

$\overline{AZ} \parallel \overline{YD} \parallel \overline{XE} \parallel \overline{BC}$,

$AY = YX = XC$ and $AB = 12$ cm.

Find : the length of \overline{AD}

2016 Exam (9) Question (5) (a)

6

In the opposite figure :

ABC is a triangle in which

$m(\angle B) = 90^\circ$,

$D \in \overline{AB}$ such that $AD = 11$ cm.

If $BC = 12$ cm. , $DC = 13$ cm. ,

find : the length of each of \overline{BD} and \overline{AC}

2016 Exam (3) Question (5) (a)

7 In the opposite figure :

$$\overline{AB} \parallel \overline{DE} ,$$

$$m(\angle D) = 70^\circ$$

$$\text{and } m(\angle DOA) = 120^\circ$$

Find with proof : $m(\angle A)$

2016 Exam (9) Question (3) (b)

8 In the opposite figure :

$\triangle ABC$ is an equilateral triangle whose side length 6 cm.

, D is the midpoint of \overline{BC}

, E is the midpoint of \overline{BA}

Prove that : $\triangle EBD$ is an equilateral triangle and find its perimeter.

2017 Exam (14) Question (3) (a)

9 In the opposite figure :

The points D , E and F are midpoints of

\overline{AB} , \overline{BC} and \overline{AC} respectively ,

$BC = 5$ cm. and $AC = 7$ cm.

Find by proof : the perimeter of the quadrilateral DECF

2016 Exam (7) Question (3) (b)

10 In the opposite figure :

$$\overline{AZ} \parallel \overline{YD} \parallel \overline{XE} \parallel \overline{CB} ,$$

$$AY = YX = XC , AB = 18 \text{ cm.}$$

Find : The length of \overline{EB}

Model 2018 Exam (1) Question (4) (b)

11 In the opposite figure :

$$AE = EB , \overline{EX} \parallel \overline{BC}$$

$$, \overline{XY} \parallel \overline{CD} \text{ and } AD = 6 \text{ cm.}$$

Find : The length of \overline{AY}

2017 Exam (4) Question (4) (a)

12 In the opposite figure :

D , E are midpoints of \overline{AB} , \overline{AC} respectively

$$AD = 3 \text{ cm.} , AE = 2 \text{ cm.} , DE = 4 \text{ cm.}$$

Find : the perimeter of $\triangle ABC$

2018 Exam (5) Question (4) (a)

13

In the opposite figure : $\overline{DE} \parallel \overline{CB}$, $m(\angle D) = 60^\circ$, $m(\angle C) = 50^\circ$ **Find :** $m(\angle DAC)$ 

2016 Exam (6) Question (4) (b)

14

In the opposite figure :

ABC is a triangle in which D , E and F are the midpoints of \overline{AB} , \overline{BC} and \overline{CA} respectively.

$BC = 12$ cm. , and $AC = 10$ cm.

Find : the perimeter of the quadrilateral DECF

2018 Exam (14) Question (5) (a)

15

In the opposite figure :

$AB = 10$ cm. , $BC = 16$ cm. , and $AC = 14$ cm. ,

D , E and F are the midpoints of \overline{AB} , \overline{BC} , and \overline{AC} respectively.

Prove that :

The perimeter of $\triangle DEF = 20$ cm.

2018 Exam (1) Question (3) (b)

16

In the opposite figure :

$AC = BC$ in the triangle ABC , E is the midpoint of \overline{AB} ,

$\overline{EF} \parallel \overline{AC}$, H and G are the midpoints of \overline{BD} , \overline{CD} respectively

Prove that : $EF = GH = BF$ 

2016 Exam (1) Question (5) (b)

17

In the opposite figure : $m(\angle A) = m(\angle B) = 25^\circ$ **Find :** $m(\angle ACD)$ 

Model 2018 Exam (1) Question (3) (a)

Homework

[A] : Choose The Correct Answer :

1	The number of axis of symmetry of a square equal	(a) 0	(b) 1	(c) 2	(d) 4
2	The parallelogram whose diagonals are perpendicular to each other and not equal in length is called	(a) a square	(b) a rectangle	(c) a rhombus	(d) a trapezium
3	The rectangle of perpendicular diagonals is	(a) a parallelogram.	(b) a square.	(c) a rhombus.	(d) a trapezium.
4	The hexagon has sides.	(a) 5	(b) 6	(c) 7	(d) 8
5	The edge length of a cube whose total area is 600 cm^2 is cm.	(a) 10	(b) 100	(c) 300	(d) 90
6	The measure of the right angle =	(a) 180	(b) 90	(c) 120	(d) 0
7	In $\triangle ABC$, if D and E are the midpoints of AB and AC respectively , $BC = 8 \text{ cm}$, then $DE =$ cm.	(a) 16	(b) 8	(c) 4	(d) 2
8	The measure of the exterior angle of the equilateral triangle =	(a) 60°	(b) 90°	(c) 30°	(d) 120°
9	The diagonal of square divided its vertex angle in two angles of the measure of each of them is	(a) 30°	(b) 45°	(c) 60°	(d) 90°
10	In a parallelogram if the adjacent sides are equal in the length , then the shape is	(a) square.	(b) rhombus.	(c) rectangle.	(d) trapezium.
11	If ABCD is a parallelogram , then $m(\angle A) = m(\angle \dots\dots\dots)$	(a) B	(b) C	(c) D	(d) nothing
12	The diagonal of the square makes an angle of measure with any of its sides.	(a) 60°	(b) 45°	(c) 120°	(d) 90°
13	The sum of the measures of the accumulative angles at a point =	(a) 90°	(b) 180°	(c) 270°	(d) 360°
14	The angle whose measure 90° is angle.	(a) acute	(b) right	(c) obtuse	(d) straight

15	If X and Y are the midpoints of \overline{AB} and \overline{AC} in $\triangle ABC$ and $XY = 3$ cm., then $BC = \dots\dots\dots$ cm. (a) 3 (b) 5 (c) 6 (d) 9
16	Any triangle has at least two $\dots\dots\dots$ interior angles. (a) right (b) obtuse (c) acute (d) reflex
17	The perimeter of a square with side length 6 cm. = $\dots\dots\dots$ cm. (a) 30 (b) 36 (c) 24 (d) 216
18	In $\triangle ABC$ if : $m(\angle A) > m(\angle B) + m(\angle C)$, then the angle A is $\dots\dots\dots$ (a) acute. (b) right. (c) obtuse. (d) straight.
19	In $\triangle ABC$ if : X , Y are the midpoints of \overline{AC} and \overline{BC} respectively , then $\overline{XY} \parallel \dots\dots\dots$ (a) \overline{AB} (b) \overline{BC} (c) \overline{AC} (d) \overline{CY}
20	* The triangle contains two $\dots\dots\dots$ angles at least (a) acute (b) obtuse (c) right (d) reflex
21	The area of square of side length 3 cm is $\dots\dots\dots$ cm^2 . (a) 9 (b) 6 (c) 12 (d) 3
22	If ABCD is a rhombus , then $\overline{AC} \perp \dots\dots\dots$ (a) \overline{BD} (b) \overline{AB} (c) \overline{BC} (d) \overline{CD}
23	ABCD is a parallelogram in which : $m(\angle A) = 60^\circ$, then $m(\angle B) = \dots\dots\dots$ (a) 30° (b) 45° (c) 60° (d) 120°
24	How many sides has a regular polygon if the measure of each interior angle of it is 120° ? (a) 5 (b) 6 (c) 7 (d) 8
25	The sum of the measures of the exterior angles of a polygon of n sides is $\dots\dots\dots$ (a) $(n - 2)$ (b) $(n - 2) \times 180^\circ$ (c) 360° (d) $\frac{(n - 2) \times 180^\circ}{n}$
26	The pentagon has $\dots\dots\dots$ sides. (a) 3 (b) 4 (c) 5 (d) 6
27	The smallest number of the acute angle in any triangle is $\dots\dots\dots$ (a) zero (b) 1 (c) 2 (d) 3
28	The right-angled triangle has $\dots\dots\dots$ right angle. (a) 1 (b) 2 (c) 0 (d) 3
29	In the opposite figure : $m(\angle A) = m(\angle C)$, $x = \dots\dots\dots^\circ$ (a) 50° (b) 130° (c) 25° (d) 180°
30	In $\triangle ABC$, if $m(\angle C) : m(\angle A) : m(\angle B) = 1 : 2 : 4$, then $\angle B$ is $\dots\dots\dots$ (a) an obtuse (b) an acute (c) a right (d) otherwise

[B] : Complete the Following : -

1 The ray drawn parallel to one side of triangle and passing through the midpoint of another side

2 In the opposite figure :

$\overline{XY} \parallel$

3 Every two vertically opposite angles are in measure.

4 The measure of each interior angle of the regular pentagon =

5 If ABCD is a parallelogram in which : $m(\angle A) = 120^\circ$, then $m(\angle B) = \dots\dots\dots^\circ$

6 The number of axes of symmetry of the rhombus is axes.

7 The ray drawn from the midpoint of a side of a triangle parallel to another side the third side.

8 In the opposite figure :

If $BC = 22$ cm.

, then $ED = \dots\dots\dots$ cm.

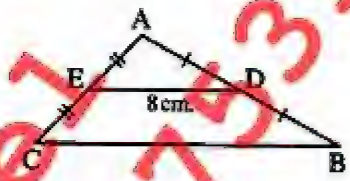

9 If two straight lines intersect , then the measures of each two vertically opposite angles are

10 The measure of each interior angle of the regular hexagon is°

11 Any triangle has at least two interior angles.

12 ABCD is parallelogram in which $m(\angle A) = 100^\circ$, then $m(\angle D) = \dots\dots\dots^\circ$

- 13 The two diagonals of the rhombus are
- 14 The measure of the exterior angle of a triangle is equal to the sum of
- 15 **In the opposite figure :**
If $ED = 8$ cm.
, then $BC =$ cm.
- 
- 16 The two vertically opposite angles are
- 17 The sum of the measures of the angles of the quadrilateral equals
- 18 If ABCD is a parallelogram in which $m(\angle A) = 80^\circ$, then $m(\angle B) =$
- 19 The rectangle is a parallelogram in which one of it's angles is
- 20 The measure of the exterior angle of any vertex of the equilateral triangle = $^\circ$
- 21 The length of the line segment joining the midpoints of two sides of a triangle equals
- 22 The sum of the measures of the accumulative angles at a point is $^\circ$
- 23 The sum of the measures of the exterior angles of the convex polygon =
- 24 ABCD is a parallelogram in which $m(\angle A) = 60^\circ$, then $m(\angle B) =$
- 25 If ABCD is rectangle and if $AB = 4$ cm. , $BD = 5$ cm. , then the area of the rectangle =
- 26 The measure of the exterior angle of a triangle is
- 27 The length of the line segment joining the midpoints of two sides of a triangle is equal to the third side.
- 28 The measure of the right angle = $^\circ$
- 29 A circle its radius length 10 cm. , then its circumference = (Consider $\pi = 3.14$)

[C] : Essay Problems : -**In the opposite figure :**

$\overline{DE} \parallel \overline{YZ}$, $m(\angle ZDE) = 50^\circ$

$m(\angle YXZ) = 105^\circ$

Find : $m(\angle Z)$, $m(\angle Y)$, $m(\angle YXD)$ **In the opposite figure :**L is a midpoint of \overline{XY}

$\overline{LM} \parallel \overline{YZ}$, $XZ = 10$ cm.

Find : the length of \overline{XM} **In the opposite figure :**ABC is a triangle in which X , Y and Z are midpoints of \overline{AB} , \overline{AC} and \overline{BC} respectively.

$AB = 8$ cm. , $AC = 10$ cm.

$BC = 7$ cm.

Find by proof : The perimeter of $\triangle XYZ$ **In the opposite figure :**

$\overline{AD} \parallel \overline{BC}$, $AD = \frac{1}{2} BC$

H and O are midpoints of \overline{DB} and \overline{DC} respectively**Prove that :** AHOD is a parallelogram**In the opposite figure :** $\triangle ABC$, in which D is the midpoint of \overline{AB} ,E is the midpoint of \overline{AC} ,O is the midpoint of \overline{BC} ,

$ED = 6$ cm. , $OD = 4$ cm. and $EO = 5$ cm.

Find : the perimeter of $\triangle ABC$ 

- 6 In the opposite figure :
 $\overrightarrow{DE} \parallel \overrightarrow{BC}$, $m(\angle D) = 100^\circ$
 , $m(\angle C) = 30^\circ$ and $A \in \overline{DB}$
 Find : $m(\angle BAC)$.

2018 Exam (11) Question (4) (a)

- 7 In the opposite figure :
 ABCD is a parallelogram its
 diagonals are intersect at M
 , $\overrightarrow{ME} \parallel \overrightarrow{AB}$ prove that $BE = EC$

2018 Exam (4) Question (3) (b)

- 8 In the opposite figure :
 $\overrightarrow{BA} \parallel \overrightarrow{CD}$, $m(\angle B) = 50^\circ$
 and $m(\angle D) = 60^\circ$
 Find with proof :
 $m(\angle CED)$

2016 Exam (4) Question (3) (a)

- 9 In the opposite figure :
 D and E are midpoints of \overline{AB} and \overline{AC}
 , $AB = 12$ cm. , $BC = 18$ cm. and $AC = 16$ cm.
 Find with proof : the perimeter of figure ECBD

2016 Exam (6) Question (5) (b)

- 10 In the opposite figure :
 ABC is a triangle in which D , E , O are midpoints
 of \overline{AB} , \overline{BC} , \overline{AC} respectively , $\overrightarrow{DE} \parallel \overrightarrow{AC}$
 $AB = 6$ cm. , $BC = 8$ cm. , $AC = 10$ cm.
 Find with prove the perimeter of : $\triangle EDO$

2018 Exam (2) Question (3) (a)

- 11 Complete :
 The line segment joining the midpoints of two sides of a triangle is

2017 Exam (1) Question (4) (a)

- 12 Prove that : The sum of the measures of the interior angles of a triangle is 180°

2016 Exam (11) Question (3) (a)

- 13 In the opposite figure :
 $AD = DB$, $AE = EC$, $\overline{AX} \parallel \overline{BC}$
 $\overline{DE} \cap \overline{XC} = \{Y\}$,
 prove that : Y is the midpoint of \overline{XC}

2018 Exam (12) Question (5) (a)

- 14 In the opposite figure :
 $\overline{EO} \parallel \overline{CD}$, $m(\angle E) = 50^\circ$
 $m(\angle C) = 30^\circ$,
 Find the measures of angles of $\triangle ABC$, $m(\angle ABD)$

Model 2018 Exam (2) Question (5) (a)

- 15 In the opposite figure :
 D is the midpoint of \overline{AB} , E is the midpoint of \overline{AC}
 $\overline{DF} \cap \overline{BC} = \{X\}$, $DX = XF$ and $BC = 12$ cm.
 Find : the length of \overline{XY}

2018 Exam (13) Question (4) (a)

- 16 In the opposite figure :
 $m(\angle A) = 85^\circ$, $m(\angle D) = 100^\circ$
 $m(\angle C) = 50^\circ$, $m(\angle E) = 35^\circ$
 Find with proof each of :
 (1) $m(\angle DOB)$ (2) $m(\angle B)$

2017 Exam (2) Question (4) (a)

- 17 In the opposite figure :
 X is the midpoint of \overline{AB}
 $Y \in \overline{CD}$, $Z \in \overline{CE}$
 $\overline{AD} \parallel \overline{XY} \parallel \overline{BC}$, $\overline{YZ} \parallel \overline{DE}$
 Is $CZ = ZE$? giving reason

Model 2018 Exam (2) Question (5) (b)

Lesson [4] : Pythagoras Theorem

The sum of areas of the squares on the sides of the right angle of a right-angled triangle is the same as the area of the square on the hypotenuse.

We can also write the previous theorem as follows :

In a right-angled triangle, the square of the length of the hypotenuse is equal to the sum of the squares of the lengths of the other two sides.

i.e. If ABC is a right-angled triangle at A, then :

$$(BC)^2 = (AB)^2 + (AC)^2$$

• From the previous relation, we can deduce the following two relations :

$$(AB)^2 = (BC)^2 - (AC)^2$$

$$(AC)^2 = (BC)^2 - (AB)^2$$

Remark [1]

You can get three numbers representing the lengths of sides of a right-angled triangle as follows :

- 1 If M is an even number bigger than 2, then the numbers M , $\left(\frac{M}{2}\right)^2 - 1$, $\left(\frac{M}{2}\right)^2 + 1$
- 2 If M is an odd number bigger than 2, then the numbers M , $\frac{M^2 - 1}{2}$, $\frac{M^2 + 1}{2}$ represent three lengths of sides of a right-angled triangle as shown in the following table :

For Example :

in $\triangle ABC$, $AB = 3$ cm, $BC = 4$ cm, $m \angle (B) = 90$, $AC = \sqrt{(AB)^2 + (BC)^2} = 5$ cm

in $\triangle ABC$, $AB = 6$ cm, $BC = 8$ cm, $m \angle (B) = 90$, $AC = \sqrt{(AB)^2 + (BC)^2} = 10$ cm

in $\triangle ABC$, $AC = 15$ cm, $BC = 12$ cm, $m \angle (B) = 90$, $AB = \sqrt{(AC)^2 - (BC)^2} = 9$ cm

in $\triangle ABC$, $AC = 25$ cm, $BC = 20$ cm, $m \angle (B) = 90$, $AB = \sqrt{(AC)^2 - (BC)^2} = 15$ cm

in $\triangle ABC$, $AC = 25$ cm, $AB = 15$ cm, $m \angle (B) = 90$, $BC = \sqrt{(AC)^2 - (AB)^2} = 20$ cm

in $\triangle ABC$, $AC = 10$ cm, $AB = 6$ cm, $m \angle (B) = 90$, $BC = \sqrt{(AC)^2 - (AB)^2} = 8$ cm

Examples :

1

ABCD is a rectangle in which $AB = 6$ cm. , $AC = 10$ cm.

Find : The length of \overline{AD}

2017 Exam (9) Question (3) (b)

2

In the opposite figure :

ABC is a triangle in which $m(\angle B) = 90^\circ$

, $AB = 5$ cm. , $BC = 12$ cm.

Find : AC

2017 Exam (1) Question (5) (a)

3

In the opposite figure :

XYZ is a triangle in which $m(\angle X) = 90^\circ$

, $YZ = 20$ cm. , $XZ = 16$ cm.

Find : The length of \overline{XY}

2017 Exam (6) Question (4) (a)

4

In the opposite figure :

ABC is a triangle in which : $AD \perp BC$

If $AD = 24$ cm. , $AB = 26$ cm.

and $AC = 30$ cm.

Find : BC

2017 Exam (4) Question (4) (b)

5

In the opposite figure :

$\overline{AD} \perp \overline{BC}$, $BD = 5$ cm. ,

$DC = 16$ cm. , $AB = 13$ cm.

Find the length of : \overline{AD} , \overline{AC}

2015 Exam (5) Question (3) (b)

6

In the opposite figure :

ABCF is a quadrilateral in which :

$m(\angle ABC) = m(\angle AFC) = 90^\circ$

, $AB = 7$ cm. , $BC = 24$ cm. , $FC = 20$ cm.

Find : AC and AF

2017 Exam (11) Question (3) (b)

In the opposite figure :

ABC is a triangle in which $m(\angle B) = 90^\circ$, $D \in \overline{AB}$

Such that : $AD = 11$ cm.

, if $BC = 12$ cm. , $DC = 13$ cm. ,

Find : The length of each of \overline{BD} and \overline{AC}

Model Exam (8) Question (5) (b)

In the opposite figure :

$\triangle ABC$ in which $m(\angle B) = 90^\circ$, $\overline{AE} \parallel \overline{BC}$

, if $BC = 8$ cm. , $AC = 17$ cm.

, $D \in \overline{AB}$: $BD = 3$ cm. , $AE = 2 BC$

Find : The length of each of \overline{AD} and \overline{ED}

2017 Exam (8) Question (3) (a)

Find the length of the diagonal of a rectangle whose area 48 cm^2 and of width 6 cm.

2017 Exam (10) Question (3) (b)

In the opposite figure :

ABCD is a trapezium

, $\overline{AD} \parallel \overline{BC}$, $m(\angle A) = 90^\circ$, $\overline{AB} = 12$ cm.

, $BC = 25$ cm. , $AD = 16$ cm.

Find : The length of \overline{DC}

2017 Exam (2) Question (5) (b)

In the opposite figure :

ABCD is a quadrilateral in which $m(\angle A) = 90^\circ$

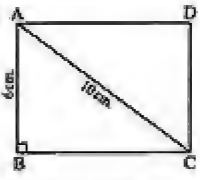

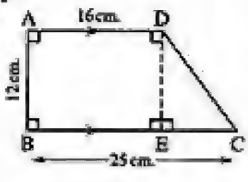

, $AB = 12$ cm. , $BC = 25$ cm. , $AD = 16$ cm. and $\overline{AD} \parallel \overline{BC}$

Find with proof : The length of \overline{DC}

2017 Exam (10) Question (5) (b)

Solutions

1	<p>to get the length of the rectangle ,</p> <p>In $\triangle ABC : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (BC)^2 = (AC)^2 - (AB)^2$</p> <p>$= 100 - 36 = 64$</p> <p>$\therefore BC = \sqrt{64} = 8 \text{ cm.}$ (The req.)</p> 
2	<p>In $\triangle ABC : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (AC)^2 = (AB)^2 + (BC)^2 = 25 + 144 = 169$</p> <p>$\therefore AC = \sqrt{169} = 13 \text{ cm.}$ (the req.)</p>
3	<p>In $\triangle XYZ : \because m(\angle X) = 90^\circ$</p> <p>$\therefore (XY)^2 = (YZ)^2 - (XZ)^2 = (20)^2 - (16)^2 = 144$</p> <p>$\therefore XY = \sqrt{144} = 12 \text{ cm.}$ (The req.)</p>
4	<p>In $\triangle ABD : \because \overline{AD} \perp \overline{BC} \therefore m(\angle ADB) = 90^\circ$</p> <p>$\therefore (BD)^2 = (AB)^2 - (AD)^2 = (26)^2 - (24)^2 = 100$</p> <p>$\therefore BD = \sqrt{100} = 10 \text{ cm.}$</p> <p>In $\triangle ADC : \because m(\angle ADC) = 90^\circ$</p> <p>$\therefore (CD)^2 = (AC)^2 - (AD)^2 = (30)^2 - (24)^2 = 324$</p> <p>$\therefore CD = \sqrt{324} = 18 \text{ cm.}$</p> <p>$\therefore BC = BD + CD = 10 + 18 = 28 \text{ cm.}$ (The req.)</p>
5	<p>In $\triangle ABD : \because m(\angle ADB) = 90^\circ$</p> <p>$\therefore (AD)^2 = (AB)^2 - (BD)^2 = (13)^2 - (5)^2 = 144$</p> <p>$\therefore AD = \sqrt{144} = 12 \text{ cm.}$</p> <p>In $\triangle ADC : \because m(\angle ADC) = 90^\circ$</p> <p>$\therefore (AC)^2 = (AD)^2 + (CD)^2 = (12)^2 + (16)^2 = 400$</p> <p>$\therefore AC = \sqrt{400} = 20 \text{ cm.}$ (The req.)</p>
6	<p>In $\triangle ABC : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (AC)^2 = (AB)^2 + (BC)^2 = (7)^2 + (24)^2 = 625$</p> <p>$\therefore AC = \sqrt{625} = 25 \text{ cm.}$</p> <p>In $\triangle AFC : \because m(\angle F) = 90^\circ$</p> <p>$\therefore (AF)^2 = (AC)^2 - (FC)^2 = (25)^2 - (20)^2 = 225$</p> <p>$\therefore AF = \sqrt{225} = 15 \text{ cm.}$ (the req.)</p>
7	<p>In $\triangle BCD : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (BD)^2 = (DC)^2 - (BC)^2 = 169 - 144 = 25$</p> <p>$\therefore BD = \sqrt{25} = 5 \text{ cm.}$</p> <p>$\therefore AB = 5 + 11 = 16 \text{ cm.}$</p> <p>In $\triangle ABC : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (AC)^2 = (AB)^2 + (BC)^2 = 256 + 144 = 400$</p> <p>$\therefore AC = \sqrt{400} = 20 \text{ cm.}$ (The req.)</p>
8	<p>In $\triangle ABC : \because m(\angle B) = 90^\circ$</p> <p>$\therefore (AB)^2 = (AC)^2 - (BC)^2 = 289 - 64 = 225$</p> <p>$\therefore AB = \sqrt{225} = 15 \text{ cm.}$</p> <p>$\therefore AD = AB - DB = 15 - 3 = 12 \text{ cm.}$</p> <p>$\therefore AE = 2 \text{ BC} \therefore AE = 2 \times 8 = 16 \text{ cm.}$</p> <p>$\therefore \overline{AE} \parallel \overline{BC} \therefore \overline{AB}$ is a transversal</p> <p>$\therefore m(\angle A) = m(\angle B) = 90^\circ$ (alternate angles)</p> <p>$\therefore (ED)^2 = (AD)^2 + (AE)^2 = 144 + 256 = 400$</p> <p>$\therefore ED = \sqrt{400} = 20 \text{ cm.}$ (The req.)</p>
9	<p>\therefore The length $= \frac{48}{6} = 8 \text{ cm.}$</p> <p>$\therefore$ The length of diagonal $= \sqrt{8^2 + 6^2} = 10 \text{ cm.}$ (The req.)</p>
10	<p>ABFD is a rectangle</p> <p>$\therefore DF = AB = 12 \text{ cm.}$</p> <p>$\therefore AD = BE = 16 \text{ cm.}$</p> <p>$\therefore FC = 25 - 16 = 9 \text{ cm.}$</p> <p>$\therefore m(\angle DFC) = 90^\circ$</p> <p>$\therefore (DC)^2 = (DF)^2 + (FC)^2 = 144 + 81 = 225$</p> <p>$\therefore DC = \sqrt{225} = 15 \text{ cm.}$ (The req.)</p>
11	<p>Construction : Draw $\overline{DE} \perp \overline{BC}$</p> <p>Proof : ABED is a rectangle</p> <p>$\therefore DE = AB = 12 \text{ cm.}$</p> <p>$\therefore AD = BE = 16 \text{ cm.}$</p> <p>$\therefore EC = 25 - 16 = 9 \text{ cm.}$</p> <p>$\therefore m(\angle DEC) = 90^\circ$</p> <p>$\therefore (DC)^2 = (DE)^2 + (EC)^2 = 144 + 81 = 225$</p> <p>$\therefore DC = \sqrt{225} = 15 \text{ cm.}$ (The req.)</p> 

Exercises

[A] : Choose The Correct Answer :

1	In ΔABC if $m(\angle A) = m(\angle B) + m(\angle C)$, then $m(\angle A) = \dots\dots\dots$ (a) 180° (b) 45° (c) 90° (d) 120°
2	In ΔABC , if $m(\angle A) + m(\angle C) = m(\angle B)$, then $m(\angle B) = \dots\dots\dots$ (a) 180° (b) 90° (c) 45° (d) 360°
3	In ΔABC , if $m(\angle A) = m(\angle B) + m(\angle C)$, then $m(\angle C) \dots\dots\dots 90^\circ$ (a) $>$ (b) $=$ (c) $<$ (d) \geq
4	ΔABC in which $m(\angle A) = 90^\circ$, then $(AC)^2 = (BC)^2 \dots\dots\dots (AB)^2$ (a) $+$ (b) \times (c) $-$ (d) \div
5	If ΔABC is right angled at B, then $(AB)^2 = \dots\dots\dots$ (a) $(AC)^2 + (BC)^2$ (b) $(AC)^2 - (BC)^2$ (c) $(BC)^2 - (AC)^2$ (d) $(AC) - (BC)$
6	In ΔABC if $m(\angle B) = 90^\circ$, $AB = 6$ cm., $BC = 8$ cm., then $AC = \dots\dots\dots$ cm. (a) 100 (b) 8 (c) 6 (d) 10
7	In ΔABC , if $m(\angle B) = 90^\circ$, $AB = 3$ cm., $BC = 4$ cm., then $AC = \dots\dots\dots$ cm. (a) 7 (b) 1 (c) 5 (d) 4
8	In ΔABC , if $m(\angle B) = 90^\circ$, $AC = 10$ cm. and $BC = 8$ cm., then $AB = \dots\dots\dots$ cm. (a) 36 (b) $\sqrt{164}$ (c) 6 (d) 8
9	In ΔABC , if $m(\angle B) = 90^\circ$, $AB = 5$ cm., $AC = 13$ cm., then $BC = \dots\dots\dots$ cm. (a) 8 (b) 10 (c) 12 (d) 18
10	In ΔABC , if $m(\angle A) = 90^\circ$, $BC = 25$ cm. and $AC = 20$ cm., then $AB = \dots\dots\dots$ cm. (a) 20 (b) 25 (c) 10 (d) 15
11	ABC is a right-angled triangle at B, if $AC = 41$ cm. and $BC = 40$ cm., then $AB = \dots\dots\dots$ (a) 11 cm. (b) 9 cm. (c) 36 cm. (d) 21 cm.
12	In the opposite figure : $AC = \dots\dots\dots$ cm. (a) 5 (b) 7 (c) 25 (d) 625

13	<p>In the opposite figure :</p> <p>$m(\angle ACD) = \dots\dots\dots^\circ$</p> <p>(a) 40 (b) 140</p> <p>(c) 90 (d) 50</p>	
14	<p>In the opposite figure :</p> <p>$\triangle ABC$ in which $m(\angle B) = 90^\circ$</p> <p>, $AB = 3 \text{ cm}$, $BC = 4 \text{ cm}$.</p> <p>, X, Y are midpoints of \overline{AB} and \overline{BC} respectively, then :</p> <p>(1) $AC = \dots\dots\dots \text{ cm}$.</p> <p>(a) 7 (b) 6 (c) 5 (d) 4</p> <p>(2) $XY = \dots\dots\dots \text{ cm}$.</p> <p>(a) $\frac{5}{2}$ (b) 3 (c) 3.5 (d) 5</p>	
15	<p>In the opposite figure :</p> <p>The number of right-angled triangle is</p> <p>(a) 3 (b) 2</p> <p>(c) 1 (d) 0</p>	
16	<p>In the opposite figure :</p> <p>$AC = \dots\dots\dots \text{ cm}$.</p> <p>(a) 5 (b) 7</p> <p>(c) 8 (d) 6</p>	
17	<p>The sum of measures of the angles of a triangle is</p> <p>(a) 90° (b) 180° (c) 270° (d) 360°</p>	
18	<p>The sum of the interior angles of an isosceles triangle =</p> <p>(a) 180° (b) 90° (c) 60° (d) 45°</p>	
19	<p>The sum of the measures of the exterior angles of triangle =</p> <p>(a) 90° (b) 180° (c) 360° (d) 120°</p>	
20	<p>The measure of the exterior angle of the equilateral triangle =</p> <p>(a) 60° (b) 90° (c) 30° (d) 120°</p>	
21	<p>Any triangle has at least two interior angles.</p> <p>(a) right (b) obtuse (c) acute (d) reflex</p>	
22	<p>* The triangle contains two angles at least</p> <p>(a) acute (b) obtuse (c) right (d) reflex</p>	

[B] : Complete the Following : -

1	In $\triangle ABC$, if $m(\angle A) = 90^\circ$, then $(BC)^2 = \dots\dots\dots$
2	In $\triangle ABC$ if $m(\angle B) = 90^\circ$, then $(AC)^2 = \dots\dots\dots + \dots\dots\dots$
3	If ABC is a right-angled triangle at B , then $(BC)^2 = \dots\dots\dots$
4	If ABC is right-angled triangle at B , then $(AB)^2 = (AC)^2 - \dots\dots\dots$
5	In $\triangle XYZ$, $m(\angle Y) = 90^\circ$, then $(XZ)^2 = \dots\dots\dots$
6	In $\triangle XYZ$ if $m(\angle Y) = 90^\circ$, then $(XZ)^2 = \dots\dots\dots$
7	In $\triangle ABC$, if $m(\angle A) = 90^\circ$, then $(BC)^2 = (AB)^2 + \dots\dots\dots$
8	If $(AC)^2 = (AB)^2 - (BC)^2$, then the measure of angle $(\dots\dots\dots) = 90^\circ$
9	If XYZL is a rectangle , then $(XY)^2 + (YZ)^2 = (\dots\dots\dots)^2$
10	In the rectangle ABCD , $(AB)^2 + (AD)^2 = \dots\dots\dots$
11	If the measure of one angle of a triangle equals the sum of the measures of the other two angles , then the triangle is $\dots\dots\dots$
12	Area of a triangle = $\dots\dots\dots$
13	In the right-angled triangle , the area of the square on $\dots\dots\dots$ equals the sum of areas of the squares on the other two sides.
14	In the right-angled triangle , area of the square drawn on the hypotenuse equals $\dots\dots\dots$ of the lengths of the other two sides.
15	In the right-angled triangle , area of the square drawn on the hypotenuse equals $\dots\dots\dots$
16	If $\triangle ABC$ is a right-angled triangle at A , then the longest side is called $\dots\dots\dots$

- 17 If $\triangle ABC$ is a right-angled triangle at B , $AB = 6$ cm. , $BC = 8$ cm. , then $AC = \dots\dots\dots$
- 18 In $\triangle ABC$, if $m(\angle B) = 90^\circ$, $AB = 3$ cm. and $BC = 4$ cm. , then $AC = \dots\dots\dots$ cm.
- 19 The length of diagonal of a rectangle whose dimensions are 6 cm. and 8 cm. = $\dots\dots\dots$ cm.
- 20 If $\triangle XYZ$ is a right angled triangle at X , $XY = 12$ cm. and $XZ = 9$ cm. , then $YZ = \dots\dots\dots$
- 21 If ABC is a right-angled triangle at B , $AB = 20$ cm. and $AC = 25$ cm. , then $BC = \dots\dots\dots$ cm.
- 22 In the opposite figure :
 $AC = \dots\dots\dots$ cm.
- 23 In the opposite figure :
 $BC = \dots\dots\dots$ cm.
- 24 In the opposite figure :
 $AC = \dots\dots\dots$ cm.
- 25 In the opposite figure :
 The value of $x = \dots\dots\dots^\circ$
- 26 If a straight line intersects two parallel straight lines , then every two interior angles in the same side of the transversal are $\dots\dots\dots$
- 27 A circle its radius length 10 cm. , then its circumference = $\dots\dots\dots$ (Consider $\pi = 3.14$)

[C] : Essay Problems : -

1

In the opposite figure :

ABC is a right-angled triangle at B

, AC = 7.5 cm. , BC = 4.5 cm.

Find : the length of \overline{AB} 

2018 Exam (7) Question (3) (a)

2

In the opposite figure :

AB = 7 cm. , CB = 24 cm.

and DC = 20 cm.

Find : (1) The length of \overline{AC} (2) The length of \overline{AD} 

2016 Exam (8) Question (4) (a)

3

In the opposite figure : $\triangle ABC$ in which $m(\angle B) = 90^\circ$ D \in \overline{AB} such that AD = 11 cm.

, if BC = 12 cm , DC = 13 cm

Find the length of each of : \overline{AB} , \overline{AC} 

2018 Exam (10) Question (4) (a)

4

ABC is a right-angled triangle at B

If AB = 3 cm.

, AC = 5 cm.

Find : the length of \overline{BC} 

2018 Exam (15) Question (3) (b)

5

In the opposite figure : $m(\angle B) = m(\angle ACD) = 90^\circ$

, AB = 3 cm. , BC = 4 cm.

, CD = 12 cm.

Find : The length of each of \overline{AC} and \overline{AD} 

2017 Exam (7) Question (5) (a)

In the opposite figure :

$\triangle ABC$ in which $m(\angle B) = 90^\circ$, $\overline{AE} \parallel \overline{BC}$

if $BC = 12$ cm. , $AC = 20$ cm. , $D \in \overline{AB}$

such that $BD = 9$ cm. , $AE = 2 BC$

Find :

① The length of \overline{AD}

② The length of \overline{ED}

2018 Exam (13) Question (5) (a)

In the following figures , find the measure of the angle marked by (?)

2018 Exam (15) Question (5) (a)

In the opposite figure :

$BC = 3$ cm. , $CD = 4$ cm. , $DA = 13$ cm.

$m(\angle ABD) = m(\angle C) = 90^\circ$

Find with proof the length of : \overline{BD} , \overline{AB}

2018 Exam (6) Question (5) (b)

In the opposite figure :

$\triangle ABC$ in which $m(\angle B) = 90^\circ$, $\overline{AE} \parallel \overline{BC}$

, if $BC = 8$ cm. , $AC = 17$ cm.

, $D \in \overline{AB}$: $BD = 3$ cm. , $AE = 2 BC$

Find : The length of each of \overline{AD} and \overline{ED}

2017 Exam (8) Question (3) (a)

Complete :

In the right-angled triangle the area of the square on the hypotenuse equals

2016 Exam (10) Question (5) (a)

In the opposite figure :

$\overline{DC} \cap \overline{BE} = \{O\}$, $m(\angle A) = 85^\circ$,
 $m(\angle D) = 100^\circ$, $m(\angle E) = 35^\circ$ and
 $m(\angle C) = 50^\circ$

Find with proof : $m(\angle B)$

2016 Exam (2) Question (3) (a)

In the opposite proof :

Find with proof : the measures of the angles of $\triangle ABC$

2016 Exam (15) Question (5) (b)

In the opposite figure :

ABCD is a trapezium , where $\overline{AD} \parallel \overline{BC}$, $m(\angle DCB) = 90^\circ$
, $\overline{AE} \perp \overline{BC}$ and $AB = BC = 17$ cm , $AD = 9$ cm.

Find : ① The length of \overline{DC}
② The area of the trapezium ABCD

2017 Exam (15) Question (5) (a)

In the opposite figure :

$\overline{BD} \cap \overline{AO} = \{C\}$, $\overline{AB} \parallel \overline{DE}$,
 $m(\angle A) = 40^\circ$, $m(\angle B) = 90^\circ$
and $m(\angle COE) = 130^\circ$

Find : $m(\angle E)$

2016 Exam (15) Question (4) (b)

Homework

[A] : Choose The Correct Answer :

1	In $\triangle ABC$ if $m(\angle A) = m(\angle B) + m(\angle C)$, then $m(\angle A) = \dots\dots\dots$ (a) 180° (b) 45° (c) 90° (d) 120°
2	If $\triangle ABC$ is right angled at B, then $(AB)^2 = \dots\dots\dots$ (a) $(AC)^2 + (BC)^2$ (b) $(AC)^2 - (BC)^2$ (c) $(BC)^2 - (AC)^2$ (d) $(AC) - (BC)$
3	In $\triangle ABC$, if $m(\angle A) = 90^\circ$, $BC = 25$ cm. and $AC = 20$ cm., then $AB = \dots\dots\dots$ cm. (a) 20 (b) 25 (c) 10 (d) 15
4	In the opposite figure : $\triangle ABC$ in which $m(\angle B) = 90^\circ$, $AB = 3$ cm., $BC = 4$ cm. , X, Y are midpoints of \overline{AB} and \overline{BC} respectively, then : (1) $AC = \dots\dots\dots$ cm. (a) 7 (b) 6 (c) 5 (d) 4 (2) $XY = \dots\dots\dots$ cm. (a) $\frac{5}{2}$ (b) 3 (c) 3.5 (d) 5
5	The measure of the exterior angle of the equilateral triangle = $\dots\dots\dots$ (a) 60° (b) 90° (c) 30° (d) 120°
6	Any triangle has at least two $\dots\dots\dots$ angles. (a) reflex (b) obtuse (c) acute (d) right
7	If X and Y are the midpoints of \overline{AB} and \overline{AC} in $\triangle ABC$ and $XY = 3$ cm., then $BC = \dots\dots\dots$ cm. (a) 3 (b) 5 (c) 6 (d) 9
8	$\triangle ABC$ in which $m(\angle A) = 90^\circ$, then $(AC)^2 = (BC)^2 \dots\dots\dots (AB)^2$ (a) + (b) \times (c) - (d) \div
9	In $\triangle ABC$, if $m(\angle B) = 90^\circ$, $AB = 5$ cm., $AC = 13$ cm., then $BC = \dots\dots\dots$ cm. (a) 8 (b) 10 (c) 12 (d) 18
10	The sum of the measures of the exterior angles of triangle = $\dots\dots\dots$ (a) 90° (b) 180° (c) 360° (d) 120°
11	The smallest number of the acute angle in any triangle is $\dots\dots\dots$ (a) zero (b) 1 (c) 2 (d) 3

12	In $\triangle ABC$, if D and E are the midpoints of \overline{AB} and \overline{AC} respectively , $BC = 8$ cm. , then $DE = \dots\dots\dots$ cm. (a) 16 (b) 8 (c) 4 (d) 2
13	In $\triangle ABC$, if $m(\angle A) = m(\angle B) + m(\angle C)$, then $m(\angle C) \dots\dots\dots 90^\circ$ (a) $>$ (b) $=$ (c) $<$ (d) \geq
14	In $\triangle ABC$, if $m(\angle B) = 90^\circ$, $AC = 10$ cm. and $BC = 8$ cm. , then $AB = \dots\dots\dots$ cm. (a) 36 (b) $\sqrt{164}$ (c) 6 (d) 8
15	In the opposite figure : $AC = \dots\dots\dots$ cm. (a) 5 (b) 7 (c) 25 (d) 625
16	The sum of the interior angles of an isosceles triangle = $\dots\dots\dots$ (a) 180° (b) 90° (c) 60° (d) 45°
17	The right-angled triangle has $\dots\dots\dots$ right angle. (a) 1 (b) 2 (c) 0 (d) 3
18	The line segment joining the midpoints of two sides of a triangle is $\dots\dots\dots$ the third side. (a) perpendicular to (b) equal to (c) parallel to (d) bisect to
19	In $\triangle ABC$, if $m(\angle C) : m(\angle A) : m(\angle B) = 1 : 2 : 4$, then $\angle B$ is $\dots\dots\dots$ (a) an obtuse (b) an acute (c) a right (d) otherwise
20	In $\triangle ABC$, if $m(\angle A) + m(\angle C) = m(\angle B)$, then $m(\angle B) = \dots\dots\dots$ (a) 180° (b) 90° (c) 45° (d) 360°
21	In $\triangle ABC$, if $m(\angle B) = 90^\circ$, $AB = 3$ cm. , $BC = 4$ cm. , then $AC = \dots\dots\dots$ cm. (a) 7 (b) 1 (c) 5 (d) 4
22	In the opposite figure : $AC = \dots\dots\dots$ cm. (a) 5 (b) 7 (c) 8 (d) 6
23	The sum of measures of the angles of a triangle is $\dots\dots\dots$ (a) 90° (b) 180° (c) 270° (d) 360°
24	* The triangle contains two $\dots\dots\dots$ angles at least (a) acute (b) obtuse (c) right (d) reflex

[B] : Complete the Following : -

1	In ΔABC , if $m(\angle A) = 90^\circ$, then $(BC)^2 = \dots\dots\dots$
2	If ΔXYZ is a right angled triangle at X , $XY = 12$ cm. and $XZ = 9$ cm. , then $YZ = \dots\dots\dots$
3	If ABC is right-angled triangle at B , then $(AB)^2 = (AC)^2 - \dots\dots\dots$
4	The sum of the measures of the angles of the quadrilateral equals $\dots\dots\dots$
5	In the right-angled triangle , the area of the square on $\dots\dots\dots$ equals the sum of areas of the squares on the other two sides.
6	ABCD is parallelogram in which $m(\angle A) = 100^\circ$, then $m(\angle D) = \dots\dots\dots^\circ$
7	In ΔABC , if $m(\angle B) = 90^\circ$, $AB = 3$ cm. and $BC = 4$ cm. , then $AC = \dots\dots\dots$ cm.
8	In the parallelogram XYZL , if $m(\angle X) = \frac{1}{2} m(\angle Y)$, then $m(\angle Y) = \dots\dots\dots^\circ$
9	If a straight line intersects two parallel straight lines , then every two interior angles in the same side of the transversal are $\dots\dots\dots$
10	In the right-angled triangle , area of the square drawn on the hypotenuse equals $\dots\dots\dots$
11	ABCD is a parallelogram in which $m(\angle A) = 130^\circ$, then $m(\angle B) = \dots\dots\dots^\circ$
12	If $(AC)^2 = (AB)^2 + (BC)^2$, then the measure of angle ($\dots\dots\dots$) $= 90^\circ$
13	Each two opposite angles in a parallelogram are $\dots\dots\dots$
14	Area of a triangle = $\dots\dots\dots$
15	If ABCD is a parallelogram in which $m(\angle A) = 80^\circ$, then $m(\angle B) = \dots\dots\dots$
16	If ABC is a right-angled triangle at B , $AB = 20$ cm. and $AC = 25$ cm. , then $BC = \dots\dots\dots$ cm.

17	The measure of each interior angle of the regular pentagon =
18	In the rectangle ABCD , $(AB)^2 + (AD)^2 = \dots\dots\dots$
19	ABCD is a parallelogram in which $m(\angle A) = 50^\circ$, then $m(\angle B) = \dots\dots\dots$
20	The length of diagonal of a rectangle whose dimensions are 6 cm. and 8 cm. = cm.
21	If ABC is a right-angled triangle at B , then $(BC)^2 = \dots\dots\dots$
22	The sum of the measures of the exterior angles of the convex polygon =
23	In $\triangle ABC$, if $m(\angle A) = 90^\circ$, then $(BC)^2 = (AB)^2 + \dots\dots\dots$
24	If two opposite sides in the quadrilateral are parallel , then it is called
25	If $\triangle ABC$ is a right-angled triangle at A , then the longest side is called
26	In the parallelogram XYZL , if $m(\angle X) = \frac{1}{3} m(\angle Y)$, then $m(\angle L) = \dots\dots\dots^\circ$
27	In $\triangle XYZ$, $m(\angle Y) = 90^\circ$, then $(XZ)^2 = \dots\dots\dots$
28	The measure of each interior angle of the regular hexagon is
29	In the right-angled triangle , area of the square drawn on the hypotenuse equals of the lengths of the other two sides.
30	If ABCD is a parallelogram in which : $m(\angle A) = 120^\circ$, then $m(\angle B) = \dots\dots\dots^\circ$
31	In $\triangle ABC$ if $m(\angle B) = 90^\circ$, then $(AC)^2 = \dots\dots\dots + \dots\dots\dots$
32	A circle its radius length 10 cm. , then its circumference = (Consider $\pi = 3.14$)
33	If the measure of one angle of a triangle equals the sum of the measures of the other two angles , then the triangle is
34	ABCD is a parallelogram in which $m(\angle A) = 60^\circ$, then $m(\angle B) = \dots\dots\dots$

[C] : Essay Problems : -**In the opposite figure :**

XYZ is right-angled triangle at X

, YZ = 20 cm. , XZ = 16 cm.

Find : the length of \overline{XY} 

2018 Exam (2) Question (5) (b)

In the opposite figure :ABCD is a quadrilateral in which $m(\angle A) = 90^\circ$, AB = 12 cm. , BC = 25 cm. , AD = 16 cm. and $\overline{AD} \parallel \overline{BC}$ **Find with proof :** The length of \overline{DC} 

2017 Exam (10) Question (5) (b)

In the opposite figure : $\overline{AD} \cap \overline{FB} = \{C\}$, $m(\angle A) = 32^\circ$, $m(\angle B) = m(\angle F) = 90^\circ$ and $m(\angle E) = 105^\circ$ **Find :** $m(\angle D)$ 

2016 Exam (7) Question (4) (b)

In the opposite figure : $\triangle ABC$ in which $m(\angle B) = 90^\circ$

, AB = 15 cm.

, BC = 20 cm.

Find with proof : The length of \overline{AC} 

2017 Exam (5) Question (4) (a)

In the opposite figure : $\overline{AD} \perp \overline{BC}$, if AD = 24 cm.

, AB = 26 cm. , AC = 30 cm.

Find :① The length of \overline{BC} ② The area of $\triangle ABC$ 

2018 Exam (9) Question (4) (a)

Lesson [5] : Geometric Transformation

Prelude

Notice the changing which happened to the position of the letter E corresponding to its previous position directly in each case of the following cases :

The first case	E	→	Э	→	E	→	Э
The second case	E	→	E	→	E	→	E
The third case	•E	→	⌢	→	Э	→	⌢
	•E	→	⌢	→	Э	→	⌢

- The geometric transformation in the first case is called : **reflection**
- The geometric transformation in the second case is called : **translation**
- The geometric transformation in the third case is called : **rotation**

The concept of the geometric transformation

In each of the following figures , notice the image of $\triangle ABC$ and deduce what happened to it :

Fig. (1)

Fig. (2)

Fig. (3)

In each of the previous figures , notice that :

- The point A has been transferred to \hat{A}
- The point B has been transferred to \hat{B}
- The point C has been transferred to \hat{C}

Thus , all the points of $\triangle ABC$ have been transferred to another position , then we say that $\triangle ABC$ has been transformed from position to another position.

Geometric transformations have many types as : reflection , translation and rotation which we will study each of them in details in the following lessons.

Lesson [6] : Reflection

Definition of reflection in a straight line

Reflection in the straight line L maps each point A to the point \hat{A} in the same plane such that :

- 1 If $A \notin L$, then the straight line L is the perpendicular bisector to the line segment $\overline{A\hat{A}}$
- 2 If $B \in L$, then B is reflected onto itself
i.e. \hat{B} coincides B

Finding the image of a point by reflection in a given straight line

- To find \hat{A} which is the image of A by reflection in the straight line L , we do as follows :

- 1 Draw an arc of a circle with centre A to cut L at B and C
- 2 With the same radius length taking B and C as centres , draw two arcs in the other side of the straight line L to intersect at \hat{A} , then \hat{A} is the image of A by reflection in L

Check by measuring that :

$\overline{A\hat{A}} \perp L$ and L bisects $\overline{A\hat{A}}$

Finding the image of a circle by reflection in a given straight line

- To find the image of a circle M by reflection in the straight line L , we do as follows :

- 1 Find the image of the centre M by reflection in L as we did before , say \hat{M}
- 2 Use the compasses with radius length equal to the radius length of the circle M to draw a circle with centre \hat{M} that will be the image of the circle M by reflection in L

Symmetry

• In the opposite figure :

ABC is a triangle , $\overline{AD} \perp \overline{BC}$, D is the midpoint of \overline{BC} , we find that :

- The image of A by reflection in L is itself (A)
- The image of B by reflection in L is C
- The image of C by reflection in L is B

i.e. The image of $\triangle ABC$ by reflection in L is $\triangle ACB$

We can say that $\triangle ABC$ is transformed to itself by reflection in the straight line L ,

Therefore the straight line L is called the axis of symmetry of $\triangle ABC$

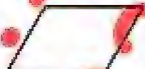

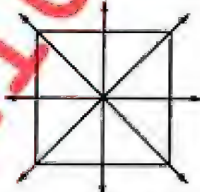

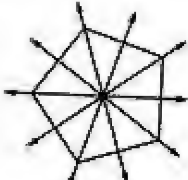

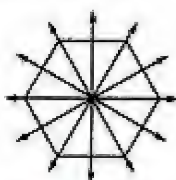

From the previous , we can deduce the definition of the axis of symmetry as follows :

If the reflection in a line transforms the figure to itself , then this line is called an axis of symmetry of the figure.

The axis of symmetry divides the figure into two congruent figures.

The axes of symmetry of some geometric figures

The figure			
Number of axes of symmetry	1	3	Zero (does not exist)
The figure			
Number of axes of symmetry	Zero (does not exist)	2	2
The figure			
Number of axes of symmetry	4	Zero (does not exist)	1

The figure			
	The circle	The regular pentagon	The regular hexagon
Number of axes of symmetry	An infinite number	5	6

Definition of reflection in a point

Reflection in a point M maps each point A in the plane to the point \hat{A} in the same plane where M is the midpoint of the line segment $\overline{AA'}$, the point M is called the centre of reflection and the image of M by reflection in M is itself.

Finding the image of a point by reflection in a given point

• To find the image of a point as A by reflection in M , we do as follows :

- 1 Draw \overline{AM}
- 2 Using the compasses with open length equals MA , then use M as a centre and draw an arc to intersect \overline{AM} at a point as \hat{A} , then \hat{A} is the image of the point A by reflection in the point M
- 3 From the previous, we found that : $MA = M\hat{A}$

Lesson [7] : Translation

i.e. To determine the new position of the car after its movement, we should know two important elements which are :

- 1 The magnitude of the translation (25 metres).
- 2 The direction of the translation (forward in a straight line).

According to this, we can say that :

Translation is a geometrical transformation which maps each point A in the plane to another point \hat{A} in the same plane with a constant distance in a certain direction.

Translation in the plane

Finding the image of a point by a given translation

• To find \hat{A} which is the image of A by translation MN in the direction of \overline{MN} , we do as follows :

- 1 Draw from A a ray parallel to \overline{MN} and in the same direction.

- 2 By the compasses in A as a centre with radius = MN , draw an arc to intersect the ray drawn from A at the point \hat{A} ($A\hat{A} = MN$ and $A\hat{A} \parallel \overrightarrow{MN}$)

• Then \hat{A} is the image of A by translation of magnitude MN in the direction of \overrightarrow{MN}

Finding the image of a polygon by a given translation

• To find the image of a polygon as $\triangle ABC$ by translation MN in the direction of \overrightarrow{MN} , we do as follows :

- 1 Find the image of each vertex of the vertices of $\triangle ABC$ by translation MN in the direction of \overrightarrow{MN} as we mentioned before (say \hat{A} for A , \hat{B} for B and \hat{C} for C)

- 2 Draw $\overline{\hat{A}\hat{B}}$, $\overline{\hat{B}\hat{C}}$ and $\overline{\hat{C}\hat{A}}$ then $\triangle \hat{A}\hat{B}\hat{C}$ is the image of $\triangle ABC$ by translation MN in the direction of \overrightarrow{MN}

Check that :

- $AB = \hat{A}\hat{B}$, $BC = \hat{B}\hat{C}$ and $CA = \hat{C}\hat{A}$
- $m(\angle A) = m(\angle \hat{A})$, $m(\angle B) = m(\angle \hat{B})$, $m(\angle C) = m(\angle \hat{C})$

From the previous , we deduce that translation is a geometrical transformation which maps the geometrical figure to another geometrical figure congruent to it.

Lesson [8] : Rotation

The concept of rotation

If M is a fixed point in the plane, then the rotation around M with an angle of measure θ is a geometric transformation transforming each point A in the plane to another point \hat{A} in the same plane such that $m(\angle AMA\hat{A}) = \theta$, $MA = M\hat{A}$ It is denoted by $R(M, \theta)$ where :

- M is the centre of rotation.
- θ is the measure of the angle of rotation.

According to this concept , the rotation is determined completely if we know the following elements

- 1 The centre of rotation.
- 2 The measure of the angle of rotation (θ)
- 3 The direction of rotation.

Remark [1]

The measure of rotation angle is positive
if the rotation is anticlockwise and it is negative
if the rotation is clockwise.

**Rotation in the plane****Finding the image of a given point by a given rotation**

Firstly : Finding the image of the point A by rotation around the point M with an angle of measure 45° i.e. $R(M, 45^\circ)$:

- Draw the ray \overrightarrow{MA}
- Put the protractor with its straight edge on \overrightarrow{MA} and in the anticlockwise direction , then draw \overrightarrow{MC} such that $m(\angle AMC) = 45^\circ$
- Use the compasses at the point M as a centre with radius = MA , draw an arc to cut \overrightarrow{MC} at \hat{A} then \hat{A} is the image of the point A by rotation around M with an angle of measure 45°

**Very Important Notes :**

The image of the point (X, y)	by reflection in the X-axis	⇒	The point $(X, -y)$
	by reflection in the y-axis	⇒	The point $(-X, y)$
	by reflection in the origin point	⇒	The point $(-X, -y)$
	by translation $(X, y) \Rightarrow (X + k, y + l)$	⇒	The point $(X + k, y + l)$
	by rotation $R(O, 90^\circ) \left(\frac{1}{4} \text{ turn}\right)$	⇒	The point $(-y, X)$
	by rotation about O with an angle of measure (-90°) or (270°)	⇒	The point $(y, -X)$
	by rotation $R(O, \pm 180^\circ) \left(\frac{1}{2} \text{ turn}\right)$	⇒	The point $(-X, -y)$
	by rotation $R(O, \pm 360^\circ)$ (identity rotation)	⇒	The point (X, y)

Examples :

1	Using the lattice , draw $\triangle ABC$ where $A(1, 0)$, $B(0, 2)$ and $C(-3, 1)$, then draw its image by reflection in X -axis. <div>2017 Exam (1) Question (5) (b)</div>
2	Using the lattice , find the image of the triangle ABC by reflection in y -axis where $A(-1, 2)$, $B(-5, 5)$, $C(-6, 3)$ <div>2017 Exam (12) Question (3) (b)</div>
3	Draw the triangle ABC in which $AB = 3$ cm. , $BC = 4$ cm. , $AC = 5$ cm. , then draw its image by reflection in \overleftrightarrow{BC} <div>2017 Exam (8) Question (5) (b)</div>
4	Draw $\triangle ABC$ in which $AB = 3.5$ cm. , $m(\angle A) = 90^\circ$, $AC = 5$ cm. , then draw its image by reflection in \overleftrightarrow{AC} <div>2017 Exam (9) Question (4) (a)</div>
5	Using the square lattice , draw $\triangle ABC$ where $A(-2, 3)$, $B(2, 3)$, $C(2, 6)$, then find the image of $\triangle ABC$ by translation $(X, y) \longrightarrow (X + 2, y - 1)$ <div>2017 Exam (13) Question (5) (b)</div>
6	Draw the rectangle ABCD in which $BC = 6$ cm. and $AB = 4$ cm. , draw the image of the rectangle ABCD by rotation $R(A, 90^\circ)$ <div>2016 Exam (5) Question (5) (a)</div>
7	In square lattice , draw $\triangle ABC$ where $A(0, 6)$, $B(-2, 1)$, $C(2, 1)$, then find : (1) The image of $\triangle ABC$ by reflection in y -axis. (2) The image of $\triangle ABC$ by rotation $(0, 180^\circ)$ <div>2017 Exam (6) Question (4) (b)</div>
8	In the opposite figure : ABCD is a square in which E , F , G and H are midpoints of \overline{AB} , \overline{BC} , \overline{CD} and \overline{AD} respectively Find : (1) The image of $\triangle MGD$ by rotation at point M by angle with measure (-90°) (2) The image of $\triangle MGD$ by reflection in \overleftrightarrow{EG} (3) The image of $\triangle MGD$ by translation (DH) in direction \overrightarrow{DH}

2017 Exam (10) Question (3) (a)

In the opposite figure :

ABC is an equilateral triangle X , Y , Z are the midpoints of \overline{AB} , \overline{AC} and \overline{BC} respectively

Find the image of : ① Δ_1 by reflection in \overleftrightarrow{XY}

② Δ_2 by translation BZ in the direction of \overleftrightarrow{BZ}

③ Δ_2 rotation R (Z , -60°)

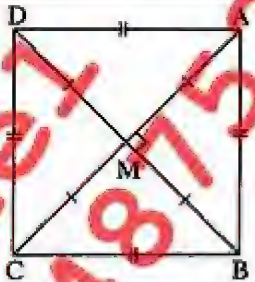

2017 Exam (3) Question (5) (a)

Solutions

Exercises

[A] : Choose The Correct Answer :

1	<p>In the opposite figure :</p> <p>The image of the point A by reflection in the point M is</p> <p>(a) A (b) B</p> <p>(c) C (d) D</p>	
2	<p>The image of the point $(2, -5)$ by reflection in X-axis is</p> <p>(a) $(-2, 5)$ (b) $(2, 5)$ (c) $(-2, -5)$ (d) $(5, 2)$</p>	
3	<p>The image of the point $(3, -5)$ by reflection in the y-axis is</p> <p>(a) $(3, 5)$ (b) $(-3, -5)$ (c) $(5, -3)$ (d) $(-3, 5)$</p>	
4	<p>The image of the point $(-1, 4)$ by the translation $(3, -2)$ is</p> <p>(a) $(2, 2)$ (b) $(-2, -2)$ (c) $(2, -2)$ (d) $(-2, 2)$</p>	
5	<p>If the image of the point $(3, -2)$ by rotation about the origin point is itself , then the measure of the rotation angle is</p> <p>(a) 90° (b) 360° (c) 180° (d) 270°</p>	
6	<p>The image of the point $(-5, 7)$ by rotation about the origin point with an angle of measure 90° is</p> <p>(a) $(-7, -5)$ (b) $(5, -7)$ (c) $(-7, 5)$ (d) $(7, 5)$</p>	
7	<p>The image of the point $(2, -1)$ by reflection in the X-axis is</p> <p>(a) $(2, 1)$ (b) $(1, 2)$ (c) $(-2, -1)$ (d) $(-1, 2)$</p>	
8	<p>The image of the point $(2, 5)$ by reflection in y-axis is</p> <p>(a) $(-2, 5)$ (b) $(5, 2)$ (c) $(-2, -5)$ (d) $(2, -5)$</p>	
9	<p>If the image of the point $(-1, 3)$ by a translation is $(T, 4)$, then the image of the point $(3, -2)$ by the same translation is</p> <p>(a) $(1, 2)$ (b) $(5, -1)$ (c) $(-1, 2)$ (d) $(-2, -1)$</p>	
10	<p>If $\hat{A}(4, -5)$ is the image of A by translation $(X, y) \longrightarrow (X-2, y+1)$ then the point A =</p> <p>(a) $(6, -4)$ (b) $(4, -4)$ (c) $(2, -4)$ (d) $(6, -6)$</p>	
11	<p>The image of the point $(4, 3)$ by rotation about the origin point with an angle of measure 90° is</p> <p>(a) $(4, 3)$ (b) $(-4, 3)$ (c) $(-3, 4)$ (d) $(-3, -4)$</p>	

12	The image of the point $(1, 5)$ by reflection in the X -axis is (a) $(1, 5)$ (b) $(1, -5)$ (c) $(5, 1)$ (d) $(-5, 1)$	
13	The image of the point $(2, -1)$ by reflection in y -axis is (a) $(2, 1)$ (b) $(-2, -1)$ (c) $(-2, 1)$ (d) $(2, -1)$	
14	The image of the point $(-1, 3)$ by translation $(4, -2)$ is (a) $(3, 1)$ (b) $(3, -1)$ (c) $(5, 1)$ (d) $(5, -5)$	
15	If the point $(a, -1)$ is the image of $(2, 4)$ by translation $(X, y) \rightarrow (X+1, y-b)$, then (a, b) is (a) $(3, 3)$ (b) $(1, 3)$ (c) $(3, 5)$ (d) $(1, -5)$	
16	The image of the point $(3, -5)$ by rotation $R(0, 90^\circ)$ is (a) $(-3, 5)$ (b) $(-3, -5)$ (c) $(5, 3)$ (d) $(5, -3)$	
17	The image of the point $(-1, 3)$ by reflection in X -axis is (a) $(1, 3)$ (b) $(3, -1)$ (c) $(-1, -3)$ (d) $(1, -3)$	
18	The image of the point $(1, -4)$ by reflection in y -axis is (a) $(-1, -4)$ (b) $(4, 1)$ (c) $(-1, 4)$ (d) $(-4, -1)$	
19	The image of the point $(-1, 3)$ by translation $(X+4, y-2)$ is (a) $(3, 1)$ (b) $(3, -1)$ (c) $(5, 1)$ (d) $(5, -5)$	
20	The image of the point $(5, -3)$ by translation 3 units in negative direction of X -axis is (a) $(-3, 5)$ (b) $(-2, -3)$ (c) $(2, -3)$ (d) $(5, 0)$	
21	The image of the point $(2, 3)$ by rotation about the origin point with an angle of measure 90° is (a) $(2, -3)$ (b) $(-2, 3)$ (c) $(-3, 2)$ (d) $(2, 3)$	
22	The reflection in the X -axis maps the point $B(X, y)$ to the point $\hat{B}(\dots\dots\dots)$ (a) (X, y) (b) $(X, -y)$ (c) $(-X, -y)$ (d) $(-X, y)$	
23	The image of the point $(-1, 3)$ by reflection in y -axis is (a) $(1, 3)$ (b) $(3, -1)$ (c) $(-1, -3)$ (d) $(1, -3)$	
24	The image of the point $(-1, 2)$ by translation of magnitude 3 units in the positive direction of y -axis is (a) $(-2, 2)$ (b) $(-1, 5)$ (c) $(-1, -5)$ (d) $(-2, 5)$	
25	The image of the point $(5, -3)$ by translation $(1, 1)$ is (a) $(6, -4)$ (b) $(4, -2)$ (c) $(6, -2)$ (d) $(4, 2)$	

[B] : Complete the Following : -

1	The image of the point $(4, 1)$ by reflection in the origin point is
2	The reflection in the X -axis maps the point $B(4, 2)$ to the point $B'(\dots, \dots)$
3	The translation is determined by and
4	The image of the point $(4, 6)$ by translation : $(X, y) \longrightarrow (X, y - 7)$ is
5	The image of the point (X, y) by rotation about the origin point is itself , then the measure of rotation angle is
6	The image of the point $(3, 2)$ by rotation with an angle of measure 180° about the origin is
7	The point $(3, 7)$ is the image of the point by reflection in the X -axis.
8	The reflection in a line reserves ,
9	The image of the point $(-4, 5)$ by translation $(2, -3)$ is
10	The neutral rotation maps the figure to
11	The image of the point $(2, -3)$ by rotation about the origin point with an angle of measure 180° is
12	The image of the point $(3, 2)$ by reflection in the X -axis is
13	$(-3, 2)$ is the image of the point $(3, 2)$ by reflection in axis.
14	The image of the point $(4, -5)$ by translation $(-2, 4)$ is
15	In the rotation around O with an angle of measure $^\circ$, the image of each point coincides exactly with itself.
16	$(-3, 2)$ is the image of the point $(-3, -2)$ by reflection in

17 The image of the point $(3, -5)$ by translation 3 units in the positive direction of X -axis is

18 Rotation in the plane reserves of angles.

19 The image of the point $(3, -5)$ by rotation $R(O, 90^\circ)$ is

20 In the opposite figure :

$ABCD$ is a square , X, Y, Z, L are midpoints of its sides then :

(1) The image of $\triangle AXO$ by reflection in \overleftrightarrow{XZ} is

(2) The image of $\triangle DZO$ by rotation $R(O, 90^\circ)$ is

(3) The image of $\triangle LOD$ by translation of magnitude DO in the direction \overrightarrow{DO} is

21 The image of the point $(2, -3)$ by reflection in X -axis is

22 The image of the point $(3, -5)$ by reflection in the y -axis is

23 The image of the point $(3, 5)$ by translation : $(x, y) \longrightarrow (x + 3, y - 1)$ is

24 In the opposite figure :

The image of the triangle XBZ

by translation XZ

in direction \overrightarrow{XZ} is

25 The image of the point $(3, 2)$ by rotation with an angle of measure 90° about the origin point is

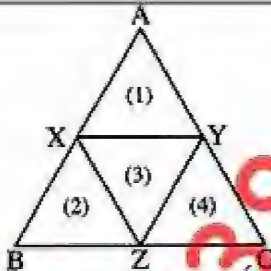

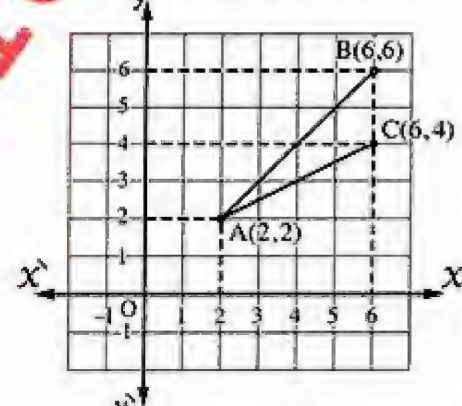

26 The image of the point $C(x, y)$ is the point $\hat{C}(-x, -y)$ by rotation around the origin point O and an angle whose measure is°

27 The image of the point $(2, 1)$ by reflection in X -axis is

28 The image of the point $(-3, 5)$ by reflection in the y -axis is

[C] : Essay Problems : -

1	If the image of the point A by reflection in the X-axis is (2 , 3) , locate the point A , then draw the image of A by reflection in the y-axis 2016 Exam (1) Question (4) (a)
2	On the orthogonal square lattice draw the triangle ABC where : $A = (1 , 1)$, $B = (3 , 4)$ and $C = (5 , 2)$, then draw the image of the triangle ABC by rotation about the origin point with an angle of measure 90° 2016 Exam (7) Question (5) (a)
3	On the square lattice , draw \overline{AB} where $A(3 , 2)$, $B(-1 , 1)$ then find its image by translation $(-2 , -5)$ 2017 Exam (7) Question (3) (b)
4	Draw ΔABC in which : $AB = 5$ cm. , $BC = 4$ cm. and $m(\angle B) = 90^\circ$, then find the image of ΔABC by reflection on \overline{AB} 2016 Exam (6) Question (3) (b)
5	Draw the image of triangle ABC where $A(1 , 1)$, $B(3 , 4)$, $C(5 , 2)$ by reflection in X-axis. Model 2018 Exam (2) Question (4) (a)
6	Draw the rectangle ABCD in which $BC = 6$ cm. and $AB = 4$ cm. , draw the image of the rectangle ABCD by rotation $R(A , 90^\circ)$ 2016 Exam (5) Question (5) (a)
7	On a square lattice , draw \overline{AB} where $A(2 , 3)$ and $B(4 , 1)$, then draw the image of \overline{AB} By rotation about the origin point with an angle of measure : (1) 90° (2) 180° 2017 Exam (5) Question (5) (a)
8	Using the square lattice , draw \overline{AB} where $A(4 , 2)$ and $B(-1 , -1)$, then find the image of \overline{AB} by translation $(x , y) \longrightarrow (x + 2 , y - 1)$ 2017 Exam (14) Question (3) (b)
9	Draw ΔABC where $A(1 , 5)$, $B(3 , 1)$ and $C(5 , 3)$, then draw its image : (1) By reflection in y-axis. (2) By rotation about origin point with an angle of measure 180° 2018 Exam (10) Question (5) (a)
10	Draw the image of ΔABC in which : $AB = 6$ cm. , $BC = 4$ cm. , $AC = 5$ cm. , by reflection in \overline{AC} 2018 Exam (12) Question (4) (b)
11	On the square lattice , draw ΔABC where $A(1 , 1)$, $B(5 , 2)$, $C(3 , 5)$, then find its image by reflection in X-axis. 2017 Exam (7) Question (4) (b)

12	<p>In the opposite figure :</p> <p>ABC is an equilateral triangle X , Y , Z are the midpoints of \overline{AB} , \overline{AC} and \overline{BC} respectively</p> <p>Find the image of : (1) Δ_1 by reflection in \overleftrightarrow{XY}</p> <p>(2) Δ_2 by translation BZ in the direction of \overrightarrow{BZ}</p> <p>(3) Δ_2 rotation R (Z , -60°)</p>	 <p>2017 Exam (3) Question (5) (a)</p>
13	<p>Draw the rectangle ABCD on a square lattice where A (0 , 0) , B (0 , 2) , C (4 , 2) , D (4 , 0) , then find its image by rotation about the origin point with an angle of measure 180°</p>	<p>2017 Exam (3) Question (4) (a)</p>
14	<p>On a square lattice , draw ΔABC , such that : A (4 , 4) , B (4 , 2) and C (1 , 2) Find its image by translation (X - 2 , y + 1)</p>	<p>2016 Exam (8) Question (5) (b)</p>
15	<p>In the opposite figure :</p> <p>Draw the image of the ΔABC by the reflection in the X-axis where A (2 , 2) , C (6 , 4) and B (6 , 6)</p>	 <p>2018 Exam (1) Question (4) (a)</p>
16	<p>Using the lattice , find the image of the triangle ABC by reflection in y-axis where A (- 1 , 2) , B (- 5 , 5) , C (- 6 , 3)</p>	<p>2017 Exam (12) Question (3) (a)</p>
17	<p>In square lattice , draw ΔABC where A (0 , 6) , B (- 2 , 1) , C (2 , 1) , then find :</p> <p>(1) The image of ΔABC by reflection in y-axis.</p> <p>(2) The image of ΔABC by rotation (0 , 180°)</p>	<p>2017 Exam (6) Question (4) (b)</p>
18	<p>On square lattice , draw the triangle whose vertices are A (5 , 5) , B (5 , 3) , C (2 , 3) , then determine each of the following :</p> <p>(1) The image of ΔABC by translation (- 2 , 2)</p> <p>(2) The image of ΔABC by reflection in y-axis.</p>	<p>2017 Exam (11) Question (5) (a)</p>

19	<p>If the point A is the image of point B $(-1, 4)$ by reflection in X-axis</p> <p>Find the image of A by translation $(1, 4)$</p> <p style="text-align: right;">2017 Exam (11) Question (4) (b)</p>
20	<p>In the square net draw $\triangle ABC$ in which A $(-2, 2)$, B $(3, 1)$, and C $(2, 5)$, then find its image by reflection in the origin point.</p> <p style="text-align: right;">2018 Exam (6) Question (5) (a)</p>

22	<p>If the point $\hat{A}(4, 5)$ is the image of the point A $(1, 7)$ by translation $(X, y) \longrightarrow (X + a, y + b)$ find :</p> <ol style="list-style-type: none"> The value of a and b The image of the point B $(2, -4)$ by the same translation. <p style="text-align: right;">2018 Exam (12) Question (5) (b)</p>
23	<p>Complete :</p> <p>If the point $(1, 4)$ is the image of the point $(-1, 3)$ by a translation (X, y) , then the image of the point $(3, -2)$ by the same translation is</p> <p style="text-align: right;">2018 Exam (10) Question (4) (b)</p>
24	<p>In the opposite figure :</p> <p>ABCD is a square , whose diagonals intersect at M</p> <p>Find :</p> <ol style="list-style-type: none"> The image of $\triangle ABC$ by reflection in \overrightarrow{AC} The image of $\triangle MAB$ by rotation about M with angle of measure (-90°) <p style="text-align: right;">2018 Exam (13) Question (5) (b)</p>
25	<p>On the lattice , find the image of the triangle LMN , where L $(-4, -1)$, M $(-1, -3)$, N $(0, -1)$ by reflection on the X-axis</p> <p style="text-align: right;">2016 Exam (5) Question (3) (b)</p>
26	<p>Find the image of the point $(2, -1)$ by rotation R $(O, 180^\circ)$</p> <p style="text-align: right;">2016 Exam (4) Question (5) (a)</p>

- 27 Find $\overrightarrow{A'B'}$ the translated image of \overrightarrow{AB} , where A (2 , 1) and B (2 , 4) when translated MN units in the direction of \overrightarrow{MN} , where M (-2 , 5) and N (3 , 7)
2018 Exam (1) Question (3) (a)
- 28 **In the opposite figure :**
ABCD is a square of side length 6 cm.
and the origin point is its centre.
Find :
① The image of $\triangle AOM$ by translation 3 cm.
in the direction of \overrightarrow{AB}
② The image of $\triangle AOM$ by rotation R (O , 90°)
③ The image of $\triangle AOM$ by reflection in \overrightarrow{EN}
2018 Exam (8) Question (4) (a)
- 29 Using the square lattice , draw the triangle ABC where A (3 , - 1) , B (5 , 2) and C (- 2 , 4) , then draw its image by rotation R (O , 180°)
2018 Exam (9) Question (3) (b)
- 30 **In the opposite figure :**
ABED is a trapezium in which $\overline{AB} \parallel \overline{DE}$
, $m(\angle D) = 90^\circ$, $\overline{BC} \perp \overline{DE}$
, $BE = DE = 17$ cm. , $AB = 9$ cm.
Find : ① The length of \overline{AD}
② The image of \overline{AB} by translation of magnitude AD in direction of \overrightarrow{AD}
2017 Exam (13) Question (4) (a)
- 31 **Draw $\triangle ABC$ and draw its image by reflection in y-axis where :**
A (- 6 , - 1) , B (- 2 , - 1) , C (- 5 , - 6)
2017 Exam (4) Question (5) (b)
- 32 **In the opposite figure :**
ABCD is a square , whose diagonal intersect at M , **find :**
① The image of $\triangle ABC$ by reflection in \overrightarrow{AC}
② The image of $\triangle MAB$ by reflection in point M
2018 Exam (10) Question (3) (b)
- 33 On a square lattice , draw the triangle ABC where A (4 , 4) , B (4 , 2) , C (1 , 2) , then find its image by rotation about the origin point with an angle of measure 180°
2018 Exam (15) Question (5) (b)

Homework

[A] : Choose The Correct Answer :

1	The image of the square by rotation about the origin point with an angle of measure 90° is	(a) rectangle. (b) square. (c) rhombus. (d) trapezium.
2	The point whose image by reflection in the origin point is itself is	(a) (1 , 0) (b) (0 , 1) (c) (0 , 0) (d) (-1 , 0)
3	The image of the point (-2 , 3) by reflection in the y-axis is the point	(a) (3 , 2) (b) (-3 , 2) (c) (2 , 3) (d) (-3 , -2)
4	The image of the point (-1 , 2) by translation of magnitude of 3 units in the positive direction of the X-axis is	(a) (-1 , 5) (b) (2 , 2) (c) (-2 , 2) (d) (-1 , 3)
5	The image of the point (-4 , 5) by translation (2 , -3) is	(a) (2 , 2) (b) (-2 , 2) (c) (2 , -2) (d) (-2 , -2)
6	The equivalent rotation to $R(O, 90^\circ)$ is $R(O, \dots^\circ)$	(a) -90 (b) 270 (c) 180 (d) -270
7	The image of the point (-2 , 1) by reflection in the origin point is	(a) (2 , 1) (b) (-2 , 1) (c) (2 , -1) (d) (-2 , -1)
8	The image of the point by reflection in y-axis is (3 , 2)	(a) (3 , -2) (b) (-3 , -2) (c) (-3 , 2) (d) (-2 , 3)
9	The image of the point (1 , -2) by translation $(X, y) \longrightarrow (X-1, y+3)$ is	(a) (2 , -5) (b) (0 , -1) (c) (0 , 1) (d) (2 , 5)
10	The image of the point (-4 , 3) by geometric transformation $(X, y) \longrightarrow (-X, y-7)$ is	(a) (-4 , -4) (b) (4 , -4) (c) (4 , 10) (d) (-4 , 10)
11	The image of the point (-1 , 4) by rotation $R(O, 180^\circ)$ is	(a) (-1 , -4) (b) (1 , -4) (c) (4 , 1) (d) (1 , 4)
12	The image of the point (3 , -7) by reflection in the origin point is	(a) (-3 , 7) (b) (-3 , -7) (c) (3 , -7) (d) (3 , 7)
13	If the image of the point (9 , -4) by rotation about the origin point is itself , then the measure of the rotation angle is	(a) 90° (b) 180° (c) 270° (d) 360°

14	The image of the point $(-3, 2)$ by reflection in y-axis is (a) $(-3, -2)$ (b) $(3, -2)$ (c) $(2, -3)$ (d) $(3, 2)$
15	The image of a rhombus by any translation is a (a) rhombus. (b) rectangle. (c) square. (d) trapezium.
16	The image of the point $(3, -2)$ by translation $(-1, 6)$ is (a) $(2, 4)$ (b) $(-2, 4)$ (c) $(7, -8)$ (d) $(2, -4)$
17	The image of a triangle by rotation around the origin point with an angle of measure 180° is (a) a triangle. (b) a line segment. (c) a point. (d) a straight line.
18	If \hat{A} is the image of A by reflection in M and $MA = 6$ cm. , then $AA =$ cm. (a) 6 (b) 3 (c) 12 (d) 9
19	The image of the point $(5, 1)$ by reflection in the origin point is (a) $(1, 5)$ (b) $(-1, -5)$ (c) $(-5, -1)$ (d) $(-1, 5)$
20	The image of the point $(-3, 4)$ by reflection in the y-axis is (a) $(3, 4)$ (b) $(3, -4)$ (c) $(-3, -4)$ (d) $(4, -3)$
21	The image of the square by any translation is a (a) rectangle (b) square (c) rhombus (d) trapezium
22	The image of the point $(3, -2)$ by translation $(-1, 4)$ is (a) $(2, 2)$ (b) $(-4, -6)$ (c) $(2, -2)$ (d) $(2, 6)$
23	The image of a triangle by rotation about the origin point with an angle of measure 360° is (a) point. (b) triangle. (c) line segment. (d) straight line.
24	In the opposite figure : $\triangle A\hat{B}\hat{C}$ is the image of $\triangle ABC$ by rotation about A with angle of measure (a) 30° (b) 80° (c) 110° (d) 140°
25	The reflected image of the point A $(-3, 2)$ in the origin point is the point \hat{A} (.....) (a) $(3, -2)$ (b) $(3, 2)$ (c) $(-3, -2)$ (d) $(2, -3)$
26	The image of the point $(-3, 2)$ by reflection on the X-axis is (a) $(-3, -2)$ (b) $(3, -2)$ (c) $(3, 2)$ (d) $(-3, 2)$
27	The image of the point $(3, 5)$ by reflection in y-axis is (a) $(-3, -5)$ (b) $(3, -5)$ (c) $(-3, 5)$ (d) $(-5, -3)$

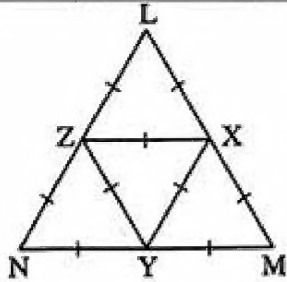

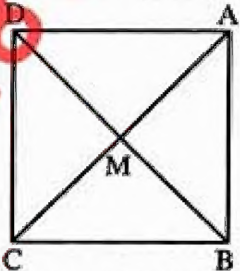

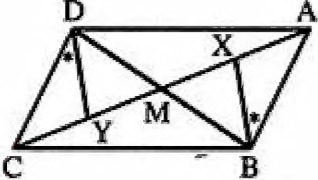

[B] : Complete the Following : -

1	If \hat{A} is the image of A by reflection in M and $MA = 6$ cm. , then $A\hat{A} = \dots\dots\dots$ cm.
2	The image of the point $(2, -4)$ by reflection in X-axis is
3	The image of the point $(2, -1)$ by rotation about the origin point with an angle of measure 180° is
4	Translation $(X, y) \longrightarrow (X + 1, y - 3)$ maps the point $(3, 4)$ to
5	The image of the point $(2, 3)$ by translation MN , in direction \overline{MN} , where M $(2, -1)$, N $(5, 1)$ is
6	The image of the point $(2, -4)$ by rotation about the origin point with an angle of measure 90° is
7	The image of the point by rotation about the origin point with an angle of measure 180° is $(-3, -2)$,
8	The image of the point $(1, 3)$ by reflection in the X-axis is
9	The image of $(3, -4)$ by reflection in y-axis is
10	The image of the point $(3, -2)$ by translation $(X, y) \longrightarrow (X - 1, y + 6)$ is
11	If $\hat{A}(7, -2)$ is the image of A by the translation whose rule is $(X, y) \longrightarrow (X - 3, y + 1)$, then A =
12	The image of the point $(2, 3)$ by rotation R $(O, 90^\circ)$ is
13	The image of the point $(4, -1)$ by rotation about the origin point with an angle of measure 180° is
14	The image of the point $(2, 4)$ by reflection in y-axis is
15	The image of the point $(2, 5)$ by translation $(X, y) \longrightarrow (X + 2, y - 3)$ is

16	If the image of the point $(-2, 4)$ by a translation is $(2, 5)$, then the image of the point $(2, -1)$ by the same translation is
17	The image of the point $(2, -3)$ by rotation about the origin point with an angle of measure 90° is
18	The image of the point $(3, -8)$ by rotation about the origin point with an angle of measure 180° is
19	If $\hat{A}(-3, -3)$ is the reflected image of the point $A(x, y)$ in the origin point $(0, 0)$, then $x = \dots\dots\dots$ and $y = \dots\dots\dots$
20	The image of the point $(-1, 3)$ by reflection in the y-axis is
21	The image of the point $(-1, 3)$ by translation $(1, 4)$ is
22	The image of the point $(-5, 6)$ by the translation $(-2, 3)$ is the point
23	The image of the point by rotation about the origin point with an angle of measure 90° is $(-1, 4)$
24	The image of the point $(3, 8)$ by rotation about the origin point with an angle of measure 180° is
25	If the image of the point A by reflection in the origin is $\hat{A}(3, -2)$, then A is $(\dots\dots\dots, \dots\dots\dots)$
26	If the point $\hat{A}(3, -2)$ is the image of A by reflection on the X -axis, then $A = (\dots\dots\dots, \dots\dots\dots)$
27	The image of the point $(-1, 3)$ by translation $(4, -2)$ is
28	The image of the point $(5, -3)$ by translation 3 units in negative direction of X -axis is
29	The image of the point $(-1, 2)$ by rotation about the origin point with angle of measure 90° is
30	The image of $(3, 7)$ by rotation $R(O, 180^\circ)$ is

[C] : Essay Problems : -

1	In a cartesian plane draw the image of ΔABC where $A(-2, 3)$, $B(2, 3)$, $C(2, 6)$ by translation $(X, y) \longrightarrow (X + 2, y - 1)$	2018 Exam (9) Question (4) (b)
2	Draw ΔABC in which $AB = 3.5$ cm. , $m(\angle A) = 90^\circ$, $AC = 5$ cm. , then draw its image by reflection in \overleftrightarrow{AC}	2017 Exam (9) Question (4) (a)
3	Using the lattice , draw ΔABC where $A(1, 0)$, $B(0, 2)$ and $C(-3, 1)$, then draw its image by reflection in X -axis.	2017 Exam (1) Question (5) (b)
4	Draw the triangle ABC in which : $AB = AC = 5$ cm. and $BC = 6$ cm. , then draw its image by rotation about A with an angle of measure 180°	2016 Exam (13) Question (4) (b)
5	Draw ΔOBC on square lattice where : $O(0, 0)$, $B(3, 0)$ and $C(0, 4)$, then find its image by rotation $R(O, -90^\circ)$	2016 Exam (10) Question (4) (a)
6	Using the lattice , draw ΔABC in which $A(-4, 1)$, $B(-1, 3)$ and $C(0, 1)$, then draw the image of ΔABC by translation $(2, 1)$	2017 Exam (9) Question (3) (a)
7	Draw the triangle ABC in which $AB = 3$ cm. , $BC = 4$ cm. , $AC = 5$ cm. , then draw its image by reflection in \overleftrightarrow{BC}	2017 Exam (8) Question (5) (b)
8	On a square lattice , draw ΔABC where $A(1, 1)$, $B(4, 1)$, $C(4, 4)$ then draw its image by reflection in X -axis.	2017 Exam (5) Question (3) (a)
9	<p>In the opposite figure :</p> <p>LMN is an equilateral triangle X, Y and Z are midpoints of \overline{LM} , \overline{MN} and \overline{NL} respectively.</p> <p>Find : (1) The image of ΔLXZ by reflection in \overleftrightarrow{XZ}</p> <p>(2) The image of \overline{XY} by rotation $(Y, 60^\circ)$</p>	 <p>2017 Exam (13) Question (3) (a)</p>
10	On a square lattice , draw ΔABC where : $A(4, 4)$, $B(4, 2)$ and $C(1, 2)$, then draw : (1) The image of ΔABC by reflection in the y -axis. (2) The image of ΔABC by rotation about the origin point with an angle of measure 270°	2016 Exam (11) Question (5) (a)

11	Using the lattice , draw \overline{AB} where $A(4, 3)$, $B(-1, 1)$, then find the image of \overline{AB} by translation $(X, Y) \longrightarrow (X + 2, Y - 1)$	2018 Exam (14) Question (3) (b)
12	Draw the triangle ABC in which : $AB = 7$ cm. , $BC = 6$ cm. and $CA = 8$ cm. , then draw its image by reflection in \overline{BC}	2018 Exam (10) Question (3) (b)
13	Draw $\triangle ABC$ where $A(1, 1)$, $B(4, 1)$, $C(4, 5)$ find its image by reflection in y-axis. By using square lattice.	2018 Exam (11) Question (4) (b)
14	In the opposite figure : ABCD is a square , M is the intersection point of its diagonal , find the image of $\triangle MAB$ by rotation about M with angle 90°	 2018 Exam (7) Question (5) (a)
15	Draw $\triangle OBC$ on a square lattice where $O(0, 0)$, $B(3, 0)$, $C(0, 4)$, then draw its image by rotation about the origin point with an angle of measure 180°	2018 Exam (2) Question (5) (a)
16	On a square lattice , draw $\triangle ABC$ where $A(4, 4)$, $B(0, 2)$, $C(6, -2)$ then find its image by translation $(X, Y) \longrightarrow (X - 4, Y + 1)$	2017 Exam (6) Question (3) (a)
17	In the opposite figure : ABCD is a parallelogram , M is the point of intersection of its diagonals and $X \in \overline{AC}$, $Y \in \overline{AC}$, such that $m(\angle ABX) = m(\angle CDY)$ Prove that : ① $\triangle ABX$ is the image of $\triangle CDY$ by reflection in M ② The figure XBYD is a parallelogram.	 2018 Exam (9) Question (5)
18	On a square lattice , draw the image of square ABDC where : $A(1, 2)$, $B(-2, 2)$, $C(1, 5)$, $D(-2, 5)$ by reflection in the y-axis.	2018 Exam (15) Question (4) (a)
19	On the square lattice draw $\triangle ABC$ where $A(1, 1)$, $B(4, 1)$, $C(4, 4)$, then determine each of the following : ① The image of $\triangle ABC$ by reflex in y-axis. ② The image of $\triangle ABC$ by rotation about origin point with angle of measure 180°	

2018 Exam (5) Question (5)

- 20 If the image of the point A (1 , 1) by translation in the coordinate plane is \hat{A} (2 , 2) , find the images of the points O (0 , 0) , B (4 , 2) , C (- 3 , 5) by the same translation.

2018 Exam (7) Question (4) (b)

- 21 **In the opposite figure :**
ABCD is a square , whose diagonals intersect at M. Find the image of Δ MAB
By rotation about M with angle of measure $(- 90^\circ)$

2018 Exam (14) Question (5) (b)

- 22 If the point A is the image of the point (- 1 , 2) by reflection in y-axis , then find the image of A by translation (- 1 , 2)

2017 Exam (2) Question (3) (a)

- 23 Draw the image of the square ABCD where A (2 , 4) , B (2 , 1) , C (5 , 1) , D (5 , 4) by reflection in the X-axis.

2018 Exam (7) Question (3) (b)

- 24 **In the opposite figure :**
ABCD is a square X , Y , Z , L are midpoints of \overline{AB} , \overline{BC} , \overline{CD} and \overline{DA} respectively

**Find :**

- ① The image of Δ AML by translation with a magnitude AM in direction \overline{AM}
- ② The image of Δ AML by rotation about the point M with an angle of measure $- 90^\circ$
- ③ The image of Δ AML by reflection in \overline{LY}

2018 Exam (2) Question (4) (b)

- 25 Using the lattice , draw Δ ABC where : A (2 , 3) , B (4 , 2) and C (1 , 2) , then draw its image by rotation about the origin point with an angle of measure 180°

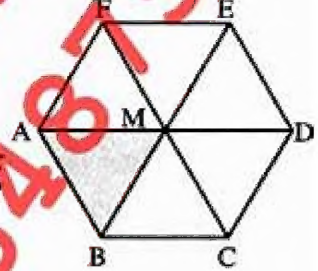

2016 Exam (15) Question (3) (a)

- 26 **In the opposite figure :**
XYZL is a trapezium , in which $\overline{XL} \parallel \overline{YZ}$, $m(\angle Y) = 90^\circ$, $\overline{LM} \perp \overline{YZ}$, $YZ = ZL = 17$ cm. , $XL = 9$ cm.

**Find :** ① The length of \overline{XY}

- ② The image of \overline{XL} by translation of magnitude XY in the direction of \overline{XY}

2018 Exam (3) Question (5)

27	In a Cartesian plane draw the image of ΔABC Where $A(1, 0)$, $B(0, 2)$, $C(-3, 1)$ by translation $(X, y) \longrightarrow (X + 2, y - 1)$ 2017 Exam (8) Question (4) (b)
28	On a square lattice, draw ΔABC where : $A(4, 4)$, $B(4, 2)$ and $C(1, 2)$, then find its image by reflection in the y-axis. 2016 Exam (14) Question (5) (b)
29	<p>In the opposite figure :</p> <p>ABCDEF is a regular hexagon</p> <p>Find the image of ΔABM by :</p> <p>① Reflection on \overleftrightarrow{EB} ② Translation FE in direction of \overleftrightarrow{FE}</p> <p>③ Rotation $(M, 120^\circ)$ ④ Reflection in M</p> <p>⑤ Rotation $(M, 300^\circ)$</p>  <p>2018 Exam (6) Question (4)</p>
30	Using the square lattice : Draw ΔXYZ in which $X(4, 1)$, $Y(5, 0)$, $Z(-1, -2)$, then draw its image by rotation about the origin point with an angle of measure (-180°) 2018 Exam (13) Question (3) (a)
31	Complete : Rotation in a plane preserve , 2018 Exam (15) Question (3) (a)
32	On the square lattice, draw ΔABC in which : $A(-2, 2)$, $B(1, 4)$ and $C(3, 1)$, then find the image of ΔABC by translation $(2, 1)$ 2016 Exam (6) Question (5) (a)
33	Draw the triangle ABC in which $AB = 3$ cm. , $BC = 4$ cm. , $m(\angle B) = 90^\circ$, then draw its image by reflection in straight line \overleftrightarrow{BC} 2018 Exam (8) Question (5) (b)
34	In a square lattice, draw the triangle OBC in which $O(0, 0)$, $B(3, 0)$, $C(1, 2)$ then find its image by reflection in the y-axis. 2017 Exam (14) Question (5) (a)
35	A rectangle its vertices are $A(-1, -2)$, $B(7, 2)$, $C(5, 6)$ and $D(-3, 2)$ Find the image of the vertices by rotation around the origin point with an angle of measure 180° 2017 Exam (4) Question (5) (a)
